Subject: ROHR TREND ALERT!!

Dear Alert Service Subscriber,
This is a critical short-term view:

The FOMC rate hike with attendant still sanguine US economic expectations for 2017 last Thursday caused a bit of a US equities setback. And while they attempted to recover there were geopolitical concerns which left them under pressure into the end of the week. And even though those seem to be abating into this morning, the US equities are still stuck around Friday's Closing levels.

The good news is that this most recent reaction still seems a very modest correction of the post-US election rally. The drop back into the lower weekly Oscillator threshold (see below) by the now front month March S&P 500 future does not damage the overall up trend. In fact, the downside reaction was a constructive development for anyone who was patient enough to wait for a setback. The question now is whether it holds the upward adjusted weekly Oscillator range or needs a further dip this week?

This is the critical consideration:

When the (now expired) December S&P 500 future pushed above the 2,180 area in late November it also finally overran the late-August 2,191.50 all-time lead S&P 500 future trading high. The expiration of the December contract last Thursday means it is now important to consider the March S&P 500 future against the weekly front month levels.

Due to the recent more aggressive increases in weekly MA-41 (as it loses old low end Closes from the sharp early year selloff) extended weekly Oscillator levels now move up roughly \$7 each week. That nearest threshold last week was 2,245-50. As such, it is important that March S&P 500 future held into the upward Oscillator shift this week to 2,252-57 at the end of last week and into this morning.

Even if it should fail, the lower Oscillator threshold is up into the 2,227-32 area this week. Yet if the March contract holds early this week, then a swing up to higher Oscillator resistance that moves up to 2,287 this week remains likely.
