Mon, Dec 13, 2021 at 11:06 AM

Dear Subscribers,

The market trends seem to be at an even a more critical inflection point on the same core battle (with other factors offsetting each other) as highlighted in Friday's 'Reopening versus Resurgence' **ALERT!!** (repeated below for your ease of access.) As noted then, there was not really that much more to say after last week's dissection of both most relevant and less than critical market influences.

While central banks are important this week along with accelerated pre-holiday economic releases (check your report and event calendars), it all still boils down to the pandemic 'resurgence' versus the 'reopening' psychology. While we will return to some of the key updates on those 'macro' developments below, it is first important to respect the markets' activity that is more critical into early this week.

That is after the very strong US equities finish last week. This is due to the front month S&P 500 future activity, which remains the December contract until late this week, with the slightly discounted (\$8) March S&P 500 future taking over on Friday morning. As we had highlighted since the initial Friday, November 26th Omicron outbreak selloff, the December S&P 500 future left a 4,695 weekly **DOWN Closing Price Reversal (CPR)** with a 4,724 Tolerance (previous week's high.) Yet it had failed to weaken back below the next lower 4,660 congestion later on last week after a couple of previous selloffs below it to the key lower 4,535 area.

And while hanging around the 4,695 area most of Friday, toward the Close it firmed up above the 4,700 area for the daily and weekly Close. This was a nominal violation of the **DOWN CPR**, which left the market in a stronger position into early this week. Yet the operative term there is 'nominal', as the market will also need to post Closes (especially a weekly Close) above that 4,724 Tolerance in order to fully Negate the **DOWN CPR**. That would indicate a new all-time high above the current, close at hand, late-November 4,740.50 high from that **DOWN CPR** week.

If that should occur, the higher weekly Oscillator thresholds are 4,780 and 4,805 this week (still moving up \$20 per week), with the next levels up into the 4,875 and 4,905 areas. This upside potential sharpens the 'burden of proof' now on bears to once again find a rationale for front month S&P 500 future to once again at least violate the next lower 4,660 interim congestion again sometime soon. That is due to that congestion having been fairly well-established since the upside churn into mid-November. With upside momentum still intact now, unless near-term support is violated sometime soon, US equities are more likely to extend the overall rally.

However, in the context of the COVID-19 Omicron variant spreading as quickly as had been feared, and the Delta variant resurgence again on the march, there is reason to consider a 'reopening' trade might still be at risk (more on that below.) That is consistent with the weakening of the non-US dollar currencies against the greenback and the bid coming back into the global govies, even if the latter have been beaten down a bit on the more upbeat psychology and Fed 'taper' fears.

That also informs our view of why the US equities decision is more critical now. That is due to it very possibly once again being the arbiter of the overall 'risk-on' psychology after previous 'bifurcated' phases between various asset classes.

The renewed synchronization of the psychology between the different markets (outside of the still domestically challenged Turkish lira) is as we have noted since last week. While this can change at

any time, it is the working assumption for now in the face of the key 'macro' reopening and resurgence influences. Weakness after this morning's US equities test of the higher resistance can be construed as the 'resurgence' at least temporarily gaining the upper hand once again, which is reasonable in the global 'macro' context. As this morning's very good Reuters article (<https://reut.rs/31UeOdB>) notes, having just the standard two-dose initial mRNA vaccination is not very effective against Omicron.

While only a partial study requiring more follow-up, it comes right into the UK announcing that the highly transmissible variant seems responsible for 40% of the new cases, and it has occurred even amongst the 'fully vaccinated' across all age ranges. There was also the first UK death from the variant. PM Johnson is quoted elsewhere as saying, "*I think the idea this is somehow a milder version of the virus - that's something we need to set on one side.*" This brings with it the potential for government restrictions, or even potential renewed public reticence on engaging in the 'gathering' economy, as we have regularly cautioned previous.

The good news is the surge in vaccinations by a freshly fearful public, which is finally taking hold to some degree in the vaccination resistant US. That said, as the trend has been for any European pandemic tendencies to make it over to the US, the outlook is still not that good. We once again share the latest CDC New US COVID-19 Cases graph (<https://bit.ly/3dKqemz>), critically updated through the end of last week that we had consistently highlighted as the key post-holiday period.

While as seen in most of November, the Monday surge in cases had lapsed back into somewhat lower new cases. Yet as noted on Friday, Monday's surge was to the horrific 190,000 level once again, and the real key would be if they continued to weaken further after Tuesday's drop. Yet that was not the case, as while they were lower than Monday they trended up during the week from the 120,000 level back to 150,000. That is not a good sign, even if vaccinations finally picked up.

Yet those levels as well are not yet at all comforting in the US, where the 'fully vaccinated' percentage finally breached the 60% level. Yet if indeed the Omicron variant can only be fought with the fully boosted vaccination, that is still only 16% of the US population, with 27.5% remaining unvaccinated. That leaves a major potential for both the Delta resurgence to become worse (now in many Northern states), and leaves a wide berth for Omicron to have a very negative impact.

Consider that the path for those with only a single dose, and especially those who are completely unvaccinated, is many months away from effective Omicron variant protection. While we do not relish the prospect in any way, it is also important to consider the more important aspect of the overall pandemic weight on the US and global economy. Rather than government quarantine or selective mandates and restrictions, it is going to be back down to public perception.

That was more important during the initial response to the pandemic during the early phase in early 2020. It will remain the key to whether many 'gathering' economy services businesses are going to experience another round of heavy weakness after being such a major part of the recent strength. That goes for external dining, domestic travel and especially international, where restrictions are already coming back, hospitality along with that, and small retail, etc.

Courtesy Repeat of Friday's 'Reopening versus Resurgence' ALERT!!

There is not really that much more to say after this week's dissection of the various most relevant and less than meaningful market influences. Among the previously considered major factors, the Fed is the least likely to affect the markets, as we revisited briefly in Thursday's "OECD Says 'Not So Fast'" ALERT!! (repeated below for your ease of access.) That is due to it likely adjusting its action to respect the US economic evolution into the other cross currents.

We will know more about that after next Wednesday's last FOMC announcements that include the next round of staff and member projections. While those hold some risk of a surprise, with the previous sanguine inflation expectations already jettisoned by Chair Powell and other members, this is not likely. In any event, the Fed Chair will finesse any of that at his post-rate (non) decision press conference.

That left the new Omicron variant as a possible key influence, until its threat was roundly dismissed by the Pfizer-BioNTech announcement on its current vaccine likely being effective for anyone who is fully boosted. And therein lies the rub, especially for the under vaccinated US that still only has roughly 60% of its folks fully vaccinated. While the Omicron 'news' is still prominent in both the financial and mainstream press, it is actually the Delta variant that is responsible for the recent pandemic 'resurgence', and will be the key factor into any renewed concerns about the recently restored economic 'reopening' psychology.

Consider for a moment the latest US CDC New COVID-19 Cases graph update (<https://bit.ly/3GvXw51> posted on its typical 2-day delay.) While the numbers have improved after Monday's explosive reading (possibly some catch-up from the typically lighter weekend reporting), at well above 100,000 they are not good. However, as we had cautioned into and after the US Thanksgiving travel and gathering weekend, the full impact of that exposure would only be clear on the numbers into the end of this week... which we will know early next week.

As such, it is not surprising that the 'reopening' versus 'resurgence' battle in the market psychology is also on hold at present after the December S&P 500 future has stalled on its vigorous test of the recent 4,695 weekly DOWN Closing Price Reversal (even though it ranged above that level closer to its 4,724 Tolerance.) However, at least so far, it has not dropped below the next lower 4,660 congestion that we had already prominently noted prior to the late-November selloff. It is therefore a 'push' into this weekend, with the full answers more likely available there and in the other asset classes next week... we shall see.

Courtesy Repeat of Thursday's "OECD Says 'Not So Fast'" ALERT!!

As we have been alerting since the beginning of the week, today's next monthly Organization for Economic Cooperation and Development Composite Leading Indicators (<https://bit.ly/3IDvYge> for our marked-up version) was going to be more important than usual. That is due to the degree to which the previous two months' releases were already indicating growth slowing. For the unfamiliar we always note that this is a net four month forward view, based on a six-month projection with a two-month delay to confirm the veracity of the various studies data.

Of course, that fits right in with the US equities forward anticipation, and tends to ignore any minor data anomalies along the way. As such, the 'Not So Fast' is a play on words both cautioning those who have an overly optimistic view into the early part of 2022, and the actual indication for future global economic growth. Notable in its analysis is, "*...signs of a possible upcoming peak in the growth of economic activity in the United States, Japan, Germany and the United Kingdom. Similar signals have now emerged in Canada and the euro area as a whole, including Italy.*" With similar signs for China (as we have already been noting for some time), the question becomes what specific indications are critical now.

As we have stressed both in and well prior to Wednesday's 'Monte Winner!' ALERT!! (repeated below for your ease of access), the Fed is a non-factor now joined by the lowered threat expectations from the COVID-19 Omicron variant. That is after Wednesday's Pfizer-BioNTech fully boosted vaccine very high efficacy announcement. That was already the case on Omicron's initial lower observed virulence. As such, our guess of how the Delta variant resurgence plays out in the various global economies seems the way to view the situation now.

As a further note on overall asset class tendencies, it was and now remains most interesting how Wednesday's highly constructive Pfizer-BioNTech announcement defusing the Omicron threat led to a more classical coordinated market response. The strength of US equities was accompanied by strength in all non-US dollar currencies, and weakness in all global govies. As a reminder, this is after so many recent 'bifurcated' intermarket trend phases for many months.

Yet it seems this 'good news' response also applies to more of the 'bad news' psychology that has returned today. That is most interesting in the context of the 'rearview mirror' economic releases being rather upbeat over the past several days (especially in the US.) There are reports of US

consumer concerns about early 2022, yet also with indications they are planning robust holiday spending.

With such seemingly constructive economic background, why are the US equities weakening, the US Dollar Index getting some 'haven' bid back after the latest dip back near the 95.70 key low end of its recent churn, and the global govies which had weakened so much on Wednesday recovering so nicely? It has been highly problematic for months to rely on the US equities as a bellwether of the overall 'risk-on' psychology, as they have often remained resilient while other asset classes reflected more of a 'risk-off' psychology. While they have succumbed as well at times, they have not led any shift to more of a 'risk-off' psychology.

However, with the current seemingly synchronized trends, we will look at them for the overall tone after this week's extension of their recent major recovery stalled in the key resistance. As also reviewed in Wednesday's 'Monte Winner!' ALERT!! (and early week analysis), March S&P 500 future (front month future on December 17th) at a \$7 discount to the December contract has only tested the key 4,694.50 weekly DOWN Closing Price Reversal (CPR) from two weeks ago. That has a Tolerance of the previous week's 4,723.50 previous all-time high. On recent historic form, even a market that came back over \$200 from the Omicron scare 4,492 front month future trading might still manage to stall into resistance.

As noted above, today's weakness is reinforced by the strength of non-US dollar currencies and the global govies significant rebound. Whether today's incipient 'risk-off' indications continue will likely depend on the forward view that is going to be at least partially determined by the public sentiment regarding the resurgent Delta variant. The key there will be whether there is any significant reversion to 'gathering' economy aversion if the news becomes much worse in the near-term.

While there is a bit of 'good' news today in Tuesday's drop back to 'just' 119,895 CDC reported US New Cases from Monday's explosion to 190,298, the rest of this week remains a very critical horizon. That is on the full indications for how bad any Thanksgiving travel and gathering surge might become in the key two weeks later time frame. As noted, Monday might have been some typical 'catch-up' from the lighter weekend reporting, as we saw during much of November. Yet if the new cases remain elevated back toward 200,000 later this week, it's a problem.

Courtesy Repeat of Friday's critical consideration (updated chart)

After the early September 4,549.50 new all-time high, the SEPTEMBER S&P 500 FUTURE violation of the 4,492 interim daily chart congestion after trading around it previous led to the violation of the prominent 4,462 area as well. And while it temporarily traded back above that, subsequent softening below it spoke of an ability to trend lower in the near term as is obvious on the weekly continuation chart updated through last Friday: <https://bit.ly/3ykHJmR>.

That left the more major 4,420-10 area as next support on both weekly MA-13 as well as that significant aggressive weekly UP Channel from the major March 2020 low. Having tested that area into the mid-September Close and violating it from the beginning of the following week was a fresh 4,410 DOWN Break. That fed further weakness which was already anticipated from the negative influence flowing out of China's Evergrande situation.

As usual there was a Tolerance below that (as seen on selloffs in both June and July) down to 4,350 area lower congestion developed during the temporary July topping activity, and retested on the mid-August sharp temporary reaction to a 4,347.75 trading low. While that seemed a broad berth, on past form only below the 4,350 area signaled a near-term trend reversal.

Yet as always with these matters, the weekly Close was more important than temporary trading weakness below it. And after the December S&P 500 future became the front month future it held against interim low-4,300 support, and ended the week back above the low 4,400 area. Yet the extent of the selloff means that it needed to be treated as a 4,410 weekly up channel DOWN Break.

The 4,348 area had reverted to the key support again on the then renewed pressure, and much like previous it was temporarily violated. The difference is that the daily 'trend flow' was quite a bit

different with the rally back above the low-4,400 area. Holding above the 4,430 area Tolerance of the 4,400-10 resistance for a weekly Close also above the (at that time) weekly MA-9 and MA-13 in the 4,435-45 area was looking more bullish again.

The next higher resistance was at the 4,472 late September trading high from which it previously dropped to the 4,300 area. That being exceeded was a further strong sign, which has not surprisingly led to the December S&P 500 future also pushing above the next minor early-September congestion in the 4,510 area, and ultimately the early September 4,549.50 front month S&P 500 future all-time high.

After that was exceeded, a 4,621 major 'swing count' was the next key threshold, with the next key weekly Oscillator thresholds up into 4,725 and 4,750, which it stalled into in mid-November. That finally precipitated a reaction that was still only initially down to 4,660 interim support. However, the Omicron news knocked it back below that area, and below the 4,621 previous upside Objective as well.

This created a weekly DOWN Closing Price Reversal CPR) from the previous week's 4,694.50 Close after the subsequent pre-Thanksgiving 4,740.50 new all-time high. This has a Tolerance of the previous week's 4,723.50 previous all-time high (as also highlighted on the weekly chart.) With December S&P 500 future already above the interim 4,660 congestion, that remains a key lower support along with the 4,621 overrun upside 'swing count' Objective along with the temporarily violated lower 4,535 congestion (also still weekly MA-13.).

Whether it can sustain activity above the 4,723.50 Tolerance of that DOWN CPR signal is going to be the arbiter of market psychology into the end of this week. Much above it (meaning the 4,740.50 all-time high as well) the weekly Oscillator thresholds into next week are as nearby as 4,775 and 4,800 (still rising \$20 per week with weekly MA-41), with extended levels another \$100 higher. However, into next week the \$7 discounted March contract will become important as well.

Thanks for your interest.
