

## RESEARCH NOTE

Friday, November 5, 2021

### **Synergistic Breakthroughs, Quick Take, Calendar**

After a couple of months of ostensibly sluggish US jobs growth, today's US Employment report addition of 531,000 jobs was not unexpected. Yet at 81,000 more than estimated, it was a breakthrough nonetheless as compared to the previous two months. It is also the case that the previously weak September Nonfarm Payrolls (NFP) were revised up 118,000, from 194,000 to 312,000, which is a much more encouraging number overall in what had been a weaker quarter.

For more detail we refer you to a very good CNBC article (<https://cnb.cx/3bL1RE8>) that drills down into the various key sector jobs gains. That the Leisure and Hospitality sector was a leading jobs gainer at 154,000 was very impressive on the continued reopening. Yet related to that in a major way is that all of it would possibly not have been quite as impressive in its own right, if it were not for the next COVID-19 pandemic self-administered therapeutic news.

While quite a bit of today's further US EQUITIES gain after the positive response to the Fed Wednesday and BoE Thursday has been attributed to the US Employment report, well ahead of its release the DECEMBER S&P 500 FUTURE traded up \$15 to the 4,687 area by 07:00 EDT. In that regard it is of note that prior to today's opening Pfizer CEO Albert Bourla was on the major networks with the announcement that his company's extensive trial of its new COVID-19 self-administered therapeutic pill ended early.

That was due to the trial showing 89% efficacy in preventing damaging COVID-19 effects in those who took the pills within three days of diagnosis. As regular readers know, we had still been a bit skeptical of the Merck therapeutic pill only having an efficacy of 50%. This makes the Pfizer pill a bona fide 'game changer'.

It was a precursor-afterburner for the stronger than expected US Employment report, as it points to the degree to which COVID-19 gathering economy (dining, hospitality, travel, etc.) hesitancy can now be fully addressed into likely no later than early 2022. The US EQUITIES psychological impact is similar to the original Pfizer-BioNTech vaccine efficacy announcement almost exactly one year ago today.

Back at that time the FRONT MONTH S&P 500 FUTURE had been churning around the old 3,397.50 February 2020 all-time high after falling back from an early September new 3,587 high. Spending the next two months stuck in the 3,200-3,500 range might have raised some concerns over the trend. Yet the Pfizer-BioNTech vaccine announcement saw it surge up to a new 3,668 all-time high. In that case vaccine news was a game changer from which the US EQUITIES never looked back.

While today's announcement is at a much higher level, at least in the near-term it is likely to drive a further 'risk-on' psychology for US EQUITIES during an already advantageous seasonal phase out of November into the end of the year. That will also be on stronger expectations for the US economy if COVID-19 hesitancy recedes further.

As previous FDA head Dr. Scott Gottlieb said in another CNBC interview this morning (<https://cnb.cx/3wkb7sf>), this means that the end of the COVID-19 pandemic is 'in sight'. While Gottlieb has previously been hopeful at times, that represents a more definitive statement. However much bad phases might remain, the overall situation is constructive.

As an aside, it is going to be interesting to see this play out in the US, where the Biden administration vaccine mandate for federal contractors (which is a very wide net) is meeting with significant blowback. Many other organizations and governments have followed the federal lead, with similar resistance. Quite a few first responders (like New York City firefighters and police) are refusing to get vaccinated, as have many hospital workers. Just to be clear, the vaccine is the more effective prevention against COVID-19 hospitalization or death.

However, if as it appears there will be an effective self-administered therapeutic that can prevent the more serious impact, will the US federal and local governments and companies stand down from their vaccination requirement? This is problematic due to major companies and governmental agencies being resistant to reversing their positions on critical issues. On the other hand, the vaccine mandates are driving some of the labor shortages in key areas.

As such, the availability of the easily administered, readily available therapeutic would address the tediously hard task of squaring that circle. While it will still leave a partisan divide on whether the anti-vaxxers were right to resist, practical implications for the global jobs markets and economies will be very positive.

That gets to the issue of what to look for next on the US EQUITIES that have seen the FRONT MONTH S&P 500 FUTURE blow out the major upside 'swing count' 4,621 Objective after stalling into it early this week? In fact, the next weekly Oscillator thresholds set up on the rally into August-November 2020 are the 4,680 and 4,705 levels into next week... with the market already straining against the higher level.

The next (ultimate) thresholds next week are from back near the top of the rally in December 2020, at 4,755 and 4,785. As such any sustained escape above the low 4,700 area at the end of this week that is sustained into next week points to those mid-upper 4,700 levels. Of note, that (not surprisingly) correlates with the major 'topping' line from the 3,587 August 2020 high across the 4,550 August 2021 high.

Yet if the US EQUITIES psychology is so strong on major economic improvements to come, why are the GLOBAL GOVVIES extending what was already a substantial recovery this week both to and above key resistance at previously failed supports? It is counterintuitive, to say the least, that the DECEMBER T-NOTE FUTURE is back up near 132.00 area, with DECEMBER GILT FUTURE well above 126.00 and DECEMBER BUND FUTURE above 169.50-170.00.

Similarly in FOREIGN EXCHANGE, the US DOLLAR INDEX is maintaining its recent bid, which is a reflection of weakness in the other DEVELOPED CURRENCIES. It is also the case that EMERGING CURRENCIES have only reacted back up modestly from their recent selloffs, which may also be related to Crude Oil recovering above 80.00.

This is a real quandary on whether there is still residual 'risk-off' sentiment out there despite the positive COVID-19 therapeutic news... which doesn't really make a lot of sense. Or is it the US leading the way up on what will indeed be a better global recovery?

That is harder to imagine in the inflationary environment that therefore should be weighing on GLOBAL GOVVIES. The only squaring of that circle might be that the therapeutic developments might assist in clearing the supply chain congestion, due to more workers being available once the COVID-19 concerns are more fully addressed. That will need to be closely monitored.

**Courtesy Repeat of Thursday's 'Central Bankers Thread the Needle' ALERT!!**

It seems that the Fed QE 'taper' is indeed not a problem for the markets, as the US EQUITIES rally extension as well as the GLOBAL GOVVIES buoyancy dismiss any notion there has been a 'taper tantrum'. Even prior to Powell's post-rate decision press conference, the FOMC Statement (<https://bit.ly/3q1c8oa>) noted that despite the slightly more aggressively lower Fed US bond and MBS purchases beginning right away this month, the Fed is leaving itself latitude to adjust that plan based on conditions.

This is something Powell also emphasized in an answer to the specific press conference (<https://bit.ly/3k6itea>) question about the somewhat earlier than expected lowering of QE purchases from later this month. It is now clear that this is at least addressing the need to react to the higher and sustained inflation at the same time as it leaves the Fed flexible if the economy should weaken for any reason (especially on the potential for any COVID-19 pandemic resurgence.)

That explains a lot about US EQUITIES extending their rally despite the 'taper', which was never going to be a major weight on the US EQUITIES in the first place. As Powell noted in another answer at his press conference, this is a totally different, much stronger US economy than back during the Bernanke regime 'taper tantrum' in mid-2013.

In Wednesday's 'Here Comes Mr. Powell' research note (repeated below for your ease of access) we also discussed the degree to which that tantrum was more so a bond market dislocation than a US EQUITIES problem. That is the background against which the current taper can best be assessed.

Then along comes the Bank of England this morning with a lack (on a 7-2 vote) of what some had expected would be a 'base rate' hike from 0.10% to 0.25% based on the degree of the major inflation surge in the UK. It also left its Asset Purchase Facility at £895 billion overall (on a 6-3 vote)... so no taper there.

During the Monetary Policy Report (<https://bit.ly/3BlwCUH> summary page link with further links to all other content) press conference Governor Bailey and his minions indulged in the same sort of legerdemain as the other central bankers have employed of late: the indication that even with inflation as high as it is, and looking to rise, in the UK it is still 'transitory' without defining that horizon. In fact, Bailey and his minions raised the central bank sleight of hand to a new height (which we say with a degree of admiration) by focusing on the degree to which nobody can know what the future path of inflation might be. That is based substantially on the degree to which the energy price increases in the UK have been so massive, yet might be transient... defined as into sometime in 2022.

It is also of note they have an idea that higher prices will also be self-correcting as they encourage production in some industries that are at the heart of the global shortage-driven inflation at present. That is for items like in computer chips, which they rightfully noted no actions by central banks can address. It is also the case that untoward rate hikes might worsen the situation by weakening the economy and suppressing capital investment. Of course, in the UK it is a further problem insofar as mortgage rates are tied to the base rate.

All in all it was a yeoman's performance by the Fed Chair and Governor Bailey (and his minions) in a situation which was a bit fraught. Especially the lack of any inflation fighting hike by the BoE this morning still likely contributing to global govies buoyancy is interesting. Yet with US EQUITIES trading up into another FRONT MONTH S&P 500 FUTURE new 4,673 all-time high, it is important to ask whether the 'bifurcated' extensive bid in GLOBAL GOVVIES is reflecting a less upbeat economic outlook into later this year despite the strong US EQUITIES seasonal.

There are also questions for the 'risk-on' psychology in FOREIGN EXCHANGE. Why is the US DOLLAR INDEX back up well above 94.00 again without having even tested its important lower 93.70 support? That said, the more volatile EMERGING CURRENCIES have recovered from their recent extended slides. Yet they are also only near important higher resistances.

Possibly the lack of that somewhat expected BoE hike has encouraged those yield sensitive items. However, energy prices have also rebounded after DECEMBER WTI CRUDE OIL FUTURE weakened from the 85.00 area this week to the low end of the key 81.00-80.00 range. While only back up to just above 81.00 at present, that still speaks of elevated prices overall.

And while we still feel the COVID-19 pandemic represents more of a risk into the Northern Hemisphere Winter than the current ubiquitous 'post-pandemic' banter suggests (see Tuesday's research note below for the full assessment), there was some good news on that front today. As reported by Reuters (<https://reut.rs/3mJ8tJq>) this morning, the UK has approved Merck's therapeutic treatment for those with an early phase of the COVID-19 infection. That has demonstrated 50 percent effective suppression of the worst symptomatic effects of the disease.

The UK approval comes with some caveats, such as it only being prescribed for folks with high risk of hospitalization and death. Yet that includes anyone with "...at least one risk factor for developing severe illness, such as obesity, older age diabetes, and heart disease." As such, a very wide net that includes many people above the age of 50, as well as those younger folks with any type of disease that represents a respiratory or immune deficiency. This is clearly a blessing for the UK that is seeing a resurgence of the pandemic despite being highly vaccinated.

The problem for the significantly under-vaccinated US (leveled off at 58.1%) is that the availability of a therapeutic will encourage the anti-vaxxers and vaccine hesitant to continue to avoid getting the shots. While having easily administered oral therapeutics is a blessing, it is indeed only 50%(+/-) effective and as such will still leave a risk of hospitalization and death. Therefore, maybe even more so in the US than the UK (or other more highly vaccinated countries) the risk factors are still very prominent. (See Tuesday's research note for more.)

### **Courtesy Repeat of Wednesday's 'Here Comes Mr. Powell' research note**

FOMC decision days are always interesting, especially now that every rate decision and statement are followed by a Fed Chair press conference. It is now Mr. Powell's duty today to explain what the Fed is going to do about tapering its now heavily extended \$120 billion QE bond and MBS purchasing programs.

That is into the face of the lower end of the labor market taking longer to recover than was expected, yet an overall strong hiring environment. There is also the strong US EQUITIES performance in the wake of another quarter of above-estimate corporate earnings. That suggests more extensive monetary stimulus may not be accomplishing much more than supporting elevated equities valuations.

Yet after so many months of signaling the QE would be gradually diminished, it is far less likely this round of lower Fed purchases will trigger anything resembling the 'taper tantrum' in the wake of Chair Bernanke's May 2013 discussion of the Fed seeing it might be time to cut back its QE purchases back then.

Putting that in context, it was the first time the Fed had ever provided quite as much liquidity, which was to offset the carnage of the 2008-2009 Credit and Housing Bust. Also of note is that the actual damage was in the bond market, which spilled dramatically into July.

Yet the US EQUITIES only reacted modestly from their new all-time high, dropping 8% into a late June low prior to returning to their major bull trend. At that time as well, the strength of the economy was a key factor in limiting the losses. Yet corporate executives are now warning on the current strong earnings, where supply chain glitches and inflation are ongoing problems.

While any Fed QE taper may be a constructive influence on the latter, there is an acceptance now that these will persist. According to a Forbes article last week, Chair Powell himself noted at a virtual conference, *“Supply constraints and elevated inflation are likely to last longer than previously expected and well into next year.”* This echoes what we reported the ECB’s Lagarde said last Thursday. This has left those corporate executives warning that the increased profits are now dependent on their ability to continue to push higher costs out in the form of higher prices to the consumer. At some point this is a very dicey proposition.

While there is no video clip, Monday’s CNBC retail outlook segment included Matthew Shay, President of US National Retail Federation. While expecting strong overall retail growth this year as the pandemic headwinds continue to abate, he also noted the inflation component of the stronger than expected 2020 full year numbers. While up 8.2%, that included a 6.5% inflation increase component.

This is something we questioned on the October release of US Advance Retail Sales for September (+0.7% versus a -0.2% estimate.) As such, the more telling influence on the future US EQUITIES trend will likely be the path of economic data after the strong corporate earnings influence lapses.

Regarding that, there is also the consideration of how much ‘rearview mirror’ economic releases have been weakening of late, and anticipation of a strong US Nonfarm Payrolls on Friday. However much current data improves, there is also the pandemic to consider.

As explored extensively in Tuesday’s ‘Bifurcation Boundary?’ research note (repeated below for your ease of access), the swing into Northern Hemisphere Winter is not a good influence after recent improvement. Please see Tuesday’s research for how this improvement is at a critical juncture at a still elevated level, and the comparison with what happened in Australia over its Winter (both of which include links to very instructive graphs on the pandemic tendencies.)

And lo and behold, what is now happening in the assumed original COVID-19 outbreak country? This morning’s Reuters article (<https://reut.rs/3mEJAyv>) notes that while the raw number of cases is comparatively low, the impact of China’s ‘zero tolerance’ policy can still bring heavy restrictions. To wit, *“Of the flights scheduled on Wednesday at Beijing Daxing Airport, 60.4% have been cancelled as of the morning, while 49.8% of flights at Beijing Capital International Airport have been scrapped.”* This once again illustrates the resilience of the pandemic even as so many folks are globally discussing the ‘post-pandemic’ environment.

And as the title and overall discussion on Tuesday’s ‘Bifurcation Boundary?’ research note indicated (along with an early chart link), the major FRONT MONTH S&P 500 FUTURE 4,621 ‘swing count’ Objective was finally hit (and temporarily traded above) this week. It is no surprise that the DECEMBER S&P 500 FUTURE is churning in that vicinity prior to the FOMC decision and Powell’s press conference. That is quite important into later this week. This is due to the next weekly Oscillator thresholds having moved up to the 4,660 and 4,685 levels this week.

FOREIGN EXCHANGE paints a less upbeat picture, as the US DOLLAR INDEX continues to hold its recovery back above the key 93.70 level temporarily violated last week prior to a sharp recovery. EMERGING CURRENCIES continue to suffer after reversing what had been a significant rally until the later part of last week. GLOBAL GOVVIES have come back under a bit of pressure, yet only after important recoveries from major lower supports that speaks of concerns over the current economic bounce.

**Courtesy Repeat of Tuesday's 'Bifurcation Boundary?' research note**

Well, it's been a long haul, but the FRONT MONTH S&P 500 FUTURE has finally made it up to the major 'swing count' Objective set up by the February-March 2020 initial COVID-19 pandemic wave economic implosion. There's nothing like multiple levels of uncertainty to drive fear and loathing in US EQUITIES and elsewhere.

Just to clear for those who do not regularly review our annotated chart views, our weekly continuation chart annotations (<https://bit.ly/3ExSKTE>) have featured that for quite a while. This is the measurement of the early 2020 selloff's 1223.50 drop from the then current 3,397.50 February 2020 all-time high to the 2,174 implosion trading low hit at the late March bottom. That projects the 4,621 Objective that seemed so far away even once the 3,397.50 high was exceeded in August 2020.

After all of the other significant price Objectives and temporary reversal signals (most prominently the 4,410 channel DOWN Break Negated into mid-October), the DECEMBER S&P 500 FUTURE is finally up testing that far more major 4,621 Objective. This is also coming at a time (mentioned in Monday's 'Technical Issues' research note) when 'rearview mirror' macro data is weakening again, and into global challenges of the still resilient COVID-19 pandemic spread despite the likely US approval of a school-age children's vaccine sometime very soon.

That factor will have to do with the degree to which resistant parents actually get the kiddies vaccinated. In current polling, there are only approximately 28% of parents motivated to get their children vaccinated right away. And the roughly 30% that likely also skipped the vaccine themselves are saying they will never get their children vaccinated; the remainder are taking a 'wait and see' attitude.

Our concerns on that remain the same as Friday's 'Indications Bifurcation' research note (repeated again below) where we also shared Australia's recent seasonal Winter experience (see below for the full Australia discussion.)

This is instructive on the 'post-pandemic' issue we find a bit disturbing for a US that has only 58% of its population fully vaccinated. As opposed to many other developed countries, it also now has aversion to additional vaccination based on resistance to the Biden administration's attempt to impose a mandate on all federal contractors (a very wide net.) While it is just part of the picture, the politicized nature of the issue in the US is highlighted in today's Reuters article (<https://reut.rs/3CFLaWG>) on worker resistance that may cost them their jobs.

As noted previous, this is with US new cases having dropped markedly on a percentage basis, yet also remaining very high in the 65,000-70,000 range. Aside from the sheer level of new cases, this was only back to the key new cases level (see CDC graph <https://bit.ly/3w9FdP5> for the full history) which was important on the way up in July 2020 and again on the way back down in April 2021.

That new daily cases and the important 7-day average are moving back up at present from that level is not a propitious sign into the Northern Hemisphere Winter being about to bite into that 'post-pandemic' attitude suggesting more than a bit of complacency. How this will play out in the US and elsewhere is yet to be seen. However, unless there is a change, it is not constructive.

This is as compared to the full vaccination rate in Australia being close to 80%, yet with a real problem in their Winter that is now ending. From late July onward the spike in cases is dramatic (<https://bit.ly/3nKb2dG>.) Once again these were significantly lower new case numbers than the US and previous in Europe. However, the proportional suggestion if the Winter outbreak in the US is even a modest percentage of what was seen in Australia is a daunting prospect.

That is in addition to the other factors, like the further slowing of the Chinese economy along with the problems of their property developers, and the very likely continuation of the combined shipping bottlenecks and inflation they are driving. Recent communication from politicians is less than encouraging in that regard, and central bankers have led us to believe they see these problems as more ingrained than previously suspected... possibly lasting well into 2022.

Along the way, the US EQUITIES strength represents a bifurcated divergence from what is occurring elsewhere. There is the recent resilience of the GLOBAL GOVVIES indicating concerns over economic strength once again. DEVELOPED CURRENCIES have stalled in their recent rally, with the US DOLLAR INDEX recovering back above its 93.70 level. EMERGING CURRENCIES have retreated from recent rallies into a significant bout of weakness as well. Not a lot of 'risk-on' out there right now.

That said, our final word on that major FRONT MONTH S&P 500 FUTURE 4,621 'swing count' Objective is that these sorts of major targets are rarely bright line technical levels. Rather than stalling outright into that area (which it has indeed already modestly exceeded), it will be important to see how it performs overall. Is this just another bull trend way station, or might it become a more significant 'bifurcation boundary' prior to a significant correction or reversal?

### **Courtesy Repeat of Wednesday's Quick Take**

After the early July downside reaction the recovery back above the 4,300 area violated support left the higher resistance into the previous week's 4,360 DOWN Closing Price Reversal with a Tolerance to 4,364. That is clear on the FRONT MONTH S&P 500 FUTURE weekly chart (<https://bit.ly/3ExSKTE> updated through Friday.) It is of note the SEPTEMBER S&P 500 FUTURE had managed to retest that area right into the ECB press conference prior to weakening once again the following Thursday morning.

And the SEPTEMBER S&P 500 FUTURE subsequently sustaining activity above the 4,425 and 4,450 weekly Oscillator thresholds was a sign of continued strength as they were still rising \$25 per week. As such, the Oscillator indications remained important after what was the 'lackluster jailbreak' after the previous outstanding US Employment report. With the market dropping back below the 4,450 level, there seemed to finally be some real risk.

Yet even below the key lower interim levels into the recent 4,425 area congestion and 4,380-65 area bottom of that, it also held key lower support in mid-August looking forward into the following week. That bigger level was 4,340 on weekly MA-13 (loosely held on all sharp reactions) at that time, and the significant aggressive weekly UP Channel from the major 2,174 March 2020 cycle low.

In the event, the recent late week recovery back above the 4,425 area pointed to the strength of the psychological recovery as well as exceeding the key technical resistance areas. That led to the recent new all-time highs above the previous week's 4,476.50 trading high (prior to the temporary selloff.) That again left the near-term Oscillator thresholds into 4,515 and 4,540 areas (on the rising MA-41), which it failed to maintain in early September, fomenting the reaction.

This led to the SEPTEMBER S&P 500 FUTURE violation of the 4,492 interim daily chart congestion after trading around it previous, with the more prominent 4.462 area also being violated two weeks ago. And while it traded back above that as well early last week, recent softening below it spoke of an ability to trend lower in the near term.

That left the more major 4,420-10 area as next support on both weekly MA-13 as well as that significant aggressive weekly UP Channel from the major March 2020 low.

Having tested that area into the mid-September Close and violating it from the beginning of the following week was a fresh 4,410 DOWN Break. That fed further weakness which was already anticipated from the negative influence flowing out of China.

As usual there was a Tolerance below that (as seen on selloffs in both June and July) down to 4,350 area lower congestion developed during the temporary July topping activity, and retested on the mid-August sharp temporary reaction to a 4,347.75 trading low. While that seemed a broad berth, on past form only below the 4,350 area does it signal a full trend reversal.

Yet as always with these matters, the weekly Close was more important than temporary trading weakness below it. And the DECEMBER S&P 500 FUTURE held against interim low-4,300 support, and ended the week back above the low 4,400 area. The extent of the temporary selloff means that it needed to be treated as a 4,410 weekly up channel DOWN Break.

Yet that also means the Close back above it established it as a Negated DOWN Break, and therefore a support area. That is also consistent with weekly MA-13 moving up to the 4,430 area this week.

That said, the 4,348 area had reverted to the key support again on the then renewed pressure. And much like previous, it was temporarily violated. The difference is that the daily 'trend flow' was quite a bit different with the rally back above the low-4,400 area. Holding above the 4,430 area Tolerance of the 4,400-10 resistance for a weekly Close also above the at that time weekly MA-9 and MA-13 in the 4,435-45 area looking more bullish again.

The next higher resistance was at the 4,472 late September trading high from which it previously dropped to the 4,300 area. That being exceeded last week was a further strong sign, which has not surprisingly led to the DECEMBER S&P 500 FUTURE also pushing above the next minor early-September congestion in the 4,510 area.

That only left the early September 4,549.50 FRONT MONTH S&P 500 FUTURE all-time high as resistance. Now that it has been exceeded, the 4,621 major 'swing count' is the next key threshold, with the next key weekly Oscillator thresholds up into the 4,660-85 area this week (rising \$20 per week.)

### ***Courtesy Repeat of Wednesday's Evolutionary Trend View***

While the **FRONT MONTH T-NOTE FUTURE** (March at the time) contract had not really challenged the mid-low 132-00 area support, the discounted JUNE T-NOTE FUTURE was only back to trading somewhat above it (as apparent on the weekly chart through Friday <https://bit.ly/3CEOJwe>.) The next key decision into mid-low 132-00 area was the March contract expiration after the JUNE T-NOTE FUTURE failure on the rally into that area.

Even as it recovered then, the bounce back above that area had failed again, with the lower support still down into the interim 130-00 area, and major support not until 128-00 area (2019-2020 congestion.) Yet the subsequent sanguine Fed attitude along with COVID-19 Delta variant concerns seemed to be supporting JUNE T-NOTE FUTURE in its recovery back above 132-00. That opened the door to the retest of the historically prominent 134-00 area seen of late.

However, the quarterly expiration saw the SEPTEMBER T-NOTE at a typical full point discount, even if it recovered nicely from recent activity back below the 132-00 area once again on the FOMC fears. While that should provide comfort to the bears, it was also a risk they could rally to retest the 134-00 area if they did not remain below 132-00. That recovery has transpired in the context of the recent COVID-19 Delta variant spread, with a rally well above 134-00.

That it is also still likely abetted by the consistent FOMC commitment to continued bond purchases, which has led to the push above the 134-00/-16 congestion from March 2020, with the next resistance as nearby as the 135-00 area into recently tested weekly MA-41 that has now dropped to the upper 134-00 area. Yet the more major DOWN Channel resistance (from the 140-235 March 2020 all-time high) is not until the mid-136-00 area.

However, in the wake of all of this inflation pressure, the SEPTEMBER T-NOTE FUTURE was holding in the mid 133-00 area. That is still only a bit below the 134-00/-16 area it subsequently traded above, and still well above the key lower 132-00 area it recovered above after slippage in March and repeated tests through June. This is all the more interesting as the pressure on the other GLOBAL GOVVIES seems to stem in part from US inflation indications.

And the SEPTEMBER T-NOTE had finally been weakening a bit below the 134-00 area, even if only slightly up until its September 21<sup>st</sup> expiration. However, even after the recent bounce, the DECEMBER T-NOTE FUTURE was still at a 24/32nds discount. That left it down into the low 133-00 area, and slipping for a vigorous test of the more important 132-00/131-16 area.

As noted previous, DECEMBER T-NOTE FUTURE weakness is particularly telling both in the context of how quickly it weakened into that area, and the next historic support not being until the 130-00 area. That is allowing that the previous sharp selloff into early April held at 130-255, essentially not any sort of historic congestion.

After a brief mid-October rally, it had finally weakened below that level and was at new lows after not being able to Close back above it on an interim rally. Yet some combination of negative sentiment factors, such as the recent serial weak economic releases and COVID-19 resurgence, had rallied it back up to the 131-00 area prior to stalling once again.

That said, the previous selloff was consistent with a 10-year yield swing to 1.66%, as expected. That was near levels seen during the April-May 1.70-1.75% range surge. The next support below the 130-00 area is not until the more major congestion area at the low end of the August 2019 through February 2020 range in the 128-00 area, which would be consistent with yields above the 1.70-1.75% range.

While the **MARCH BUND FUTURE** remained above 173.00-172.50 congestion, as expected it was a bit demoralizing that the JUNE BUND FUTURE was so far below it when it became front month future (seen in the weekly chart through Friday <https://bit.ly/3nT4k54>.)

That left it more so poised to retest the 170.50-169.75 area congestion that had reached prior to the current recovery rally, with the far more major lower recent and historic congestion in the 168.86-.00 area from the summer 2016 previous all-time high.

However, it was more important on the previous recovery whether it could once again sustain activity back above the 173.00-172.50 congestion. Yet after only rallying into that area on the recent general GLOBAL GOVVIES recovery, this previous weak sister had been back under pressure toward 170.50-169.75 area congestion on stronger European inflation indications despite rallies on central banker assurances regarding inflation.

Even its previous recovery from temporary slippage below 170.50 left it only up into the existing 173.00-172.50 congestion once again. While that leaves a long way back down to the key recently tested 170.50-169.75 area, even after fading from the contrarian FOMC bounce it was only somewhat back below that 173.00-172.50 congestion.

And that lack of any downside momentum left it hanging around the low end of that important 173.00-172.50 congestion of late, with the recent recovery back above 174.00 looking more so like a retest of the 175.00-.50 area was possible under the influence of the recent COVID-19 Delta variant spread.

And now that even that resistance has been exceeded on the extended Delta variant influence, with next congestion back in the 177.50-.00 congestion area that has been vigorously tested in recent trading. Next resistance was as nearby as 178.00 congestion, yet with the extended level in that area being the 178.77 December trading high, and its gap lower from the 178.68 high Close that same week.

On the current return to weakness below 177.00-.50 area the key lower remains the 175.50-.00 area it pushed above in mid-July after a more telling rally above the 172.00-.50 area. Yet it was now already back down into the low end of the 175.50-.00 range. While holding might have given some folks a sense of support, that was also violated into early this week.

And that was only the prelude to today's SEPTEMBER BUND FUTURE typically early month expiration with the DECEMBER BUND FUTURE trading at a full 3.00 discount. And that is with the December contract also below the 173.00-172.50 area, which seems to point to quite a bit of inflation expectation there. It also points to the potential test of the next major 170.00-169.50 congestion unless there is a recovery back above the 173.00-172.50 area. And on the recent rally it only reached the 172.00 area.

That said, previous downside leader DECEMBER BUND FUTURE Monday drop into its major 170.00-169.50 range key support has not seen any further weakness so far. The overall drop represents a yield rally to -0.20%. While that may sound quite low to others, it is well up from nearly -0.50% as recently as mid-August. Its importance is highlighted by this being the key support this side of the 168.00-167.50 range.

However, much like the T-NOTE, its selloff into May did not quite reach that area. Now that it is dropping very near that lower support after avoiding it last week, it is more critical. While next support is as nearby as the mid-166.00 area, that would indicate the 10-year yield had risen back above 0.00% for the first time since May of 2019. However, some combination of negative sentiment factors, such as the recent serial weak economic releases and the COVID-19 pandemic resurgence, had rallied it back up into a test of the 170.00-169.50 failed support.

As the co-downside leader the **MARCH GILT FUTURE** (possibly on the inflationary implications of the Brexit break with the EU) was already failing somewhat below major 130-00 congestion. That was also with the typical full point discount in the **JUNE GILT FUTURE**. That left next support into the mid-low 128.00 area it was recently below prior to rebounding.

Even though back above it once again, it remained vulnerable along with the rest of the GLOBAL GOVVIES. If it should slide further, the next major supports are not until the 126.50 and 125.50-.00 areas. Yet central banker assurances inflation will be transitory had it recently rallying back into the upper 128.00 area of late.

While the prominent resistance remains in that 130.50-.00 range congestion (violated previous 22-month trading lows), weekly chart congestion, MA-13 and the gap down from the March contract expiration all pointed to resistance in the low-mid 129.00 area into which it indeed stalled into early June.

And the GILT FUTURE expiration saw the opposite picture from the premium in SEPTEMBER BUND FUTURE. The **SEPTEMBER GILT FUTURE** was actually a typical full point below the June contract when it expired. While it was recently back down below the 128.00 area, we ascribed this to the economic differential between the previously fully reopened UK economy versus some residual drags in Europe.

While recently only modestly back above the 128.00 area, the current rally under the influence of recent UK COVID-19 Delta variant spread had it back up into to the 130.50-.00 range prior to recently backing off. It is interesting that even as the Delta variant continues to impact the UK and global economy. In that regard, the GILT not rallying any further than a retest of the high end of the 130.50-.00 area was a warning, even if it was maintaining that rally into higher resistance until the recent return of pressure.

Yet on the current weakening back below 130.50-.00 area the next support remains 128.00. While quite a ways off, the September contract expiration currently sees a **DECEMBER GILT FUTURE** that is already trading down below that lower congestion, and closer to the major 126.00-125.50 major congestion prior to the recent bounce.

That said, as the FRONT MONTH GILT FUTURE had been the weak sister previous, it failed to hold its 128.00 support on the September contract selloff. With the typical full point discount at expiration in the 'second month' DECEMBER GILT FUTURE, it was back to well below its 126.00 support. That is striking in being so far back below the 126.86 May trading low (March-May high yields near 0.90%), and insofar as the cash rate is now slightly above the psychologically important 1.00%.

The next futures support was not until the recently tested low 124.00 area. Any sustained weakness below that area (which is developing at present) points to interim congestion in the 123.00 and 122.00 areas, yet with the major low end of the full 2018 range (it is already sagging into) not until the 120.00 area (weekly MA-41 minus 9.00!!)

As such, even considering how far GLOBAL GOVVIES prices have fallen and yields have risen, the 'straight-line' factor means that if the current support fails they may have further to go prior to any stabilization or counterpoint reaction. That was very interesting of late as it scrambled back up to the 124.00 area after weakening below that area of late.

And here as well some combination of negative sentiment factors, such as the recent serial weak economic releases and the COVID-19 pandemic resurgence, had rallied it back up near the 126.00 area failed support.

In **FOREIGN EXCHANGE** the **DEVELOPED CURRENCIES** had also seen massive shifts from the Spring of 2020 prior to quieting down once again. As noted extensively throughout the year, even though the **US DOLLAR INDEX** had a 'haven' bid into mid-February 2020, it then came under extensive pressure against the other **DEVELOPED CURRENCIES** on the more upbeat global recovery outlook on the COVID-19 vaccination success despite near-term setbacks.

Yet the current higher yield anticipation was driving the 'risk-off' psychology in the vulnerable **EMERGING CURRENCIES** on a 'country' basis, even if a resilient if quieter **US DOLLAR** 'haven' bid has survived a modest rally in the **DEVELOPED CURRENCIES**. While that bid may also be partly on the basis of the recent surge in US yields, that is historically less of a significant factor compared to the prospects for inward investment overall in the context of economic prospects. It currently seems those are better in the US than the rest of the world despite the US still having an elevated COVID-19 new case rate.

After the **US DOLLAR INDEX** had failed to remain out above the 91.00-.23 range in recent trading, next lower support in the 91.00-90.50 area was violated prior to the previous squeeze above that area (as seen on the weekly chart <https://bit.ly/3nPvNEH> through Friday.) That still left historic 89.50-.00 area support tested during December through February and just missed in late May as lower support.

Yet in the wake of FOMC moving to a seemingly more aggressive tightening, it was back into 92.30-.00 area once again, which it had recently overrun. While the recent focus was back on 91.00-.50 area (including weekly MA-41) that it could not weaken back below of late, the higher interim resistances above the 92.00-.30 range are into the already violated 92.60.

That is along with the recent fresh major weekly 92.70 down channel UP Break (see the chart.) While recently slightly above the next congestion in the 93.30-.40 area (including the March 93.43 8-month trading high), back below it the 92.70-.60 area was a key consideration.

Failing below it prior to the current recovery was a negative sign which has been mitigated on the rise back above it. Whether that maintains, and whether it can invigorate stronger activity back above the 93.30-.40 area will be the key current trend indications.

Yet the market activity is clear on the **US DOLLAR INDEX** rising above 93.40 area once again. Also above the August 93.72 trading high makes this a new 10-month trading high, with next resistance not until the 94.30-74 Fall 2020 trading highs. The recent weakening of the **US DOLLAR** 'haven' bid left it struggling to hold the 93.70 area once again, yet which it has now recovered back above. Yet the weakening of other **DEVELOPED CURRENCIES** under the weight of the resurgent COVID-19 pandemic (especially in the UK and parts of Europe) had seen it to only slip quietly below that area prior to the current recovery.

With **EUR/USD** below 1.2000 again, there seemed to be more of a 'risk off' psychology again into early March, which was then independent of the strength of **EMERGING CURRENCIES**. Lower supports were back down into those 1.1815 and 1.1700 areas. That reinforced the potential for more **US DOLLAR** strength.

The next lower **EUR/USD** support into 1.1815 had been violated in late March, with next support into the 1.1700 area subsequently tested prior its subsequent rapid push back above the 1.1800 area.

That was extended as **EUR/USD** rallied above 1.2000 again, and even churned above the top of the 1.2000-1.2100 range prior to temporary slippage back below the top end of that range in recent trading. The next significant resistance above is back into the recently tested 1.2200-50 area at the bottom of the early 2018 major range, with next resistances above into the 1.2400 area interim 2018 congestion, and 1.2550 top of that range.

Yet in the wake of FOMC moving to a seemingly more aggressive tightening (now refuted), it was back below 1.2000-1.2100 range with 1.1900 area interim support being violated overall on the way to the current weakness below the 1.1815 interim support. That left the 1.1700 area more major lower support, which correlates well with the **US DOLLAR INDEX** 93.30-.40 area.

While much below that the next more major support is not until the 1.1600 area, the recovery back above the 1.1815 interim support meant that was once again the area to closely watch. And the recent sharp failure put the 1.1750 area back in play as a weekly **Head & Shoulders H&S** Top Neckline (as evident on the weekly chart through Friday <https://bit.ly/3Ey6b62>), which it quietly slipped below on a fresh 1.1800 **DOWN** Break.

Does that mean the 1.1100 Objective will be hit? Well, long before that would happen it will be important to see if it sees greater weakness below the important late-March 1.1700 area trading low than the temporary weekly Close slightly below it two weeks ago.

That is the low between the Head (H) and Right Shoulder (RS), the violation of which is always a key indication of whether the H&S Top is a bona fide pattern reversal, and fulfills at least the minimum bear trend definition of a “lower low after a lower high” (as the right shoulder by definition always is.) Yet on current form, the sheer ‘trend flow’ for the past several weeks looks bad for the bears.

Having a sizable weekly pattern DOWN Break show some progress only to not exhibit downside ‘follow through’ on the subsequent selloff felt like that overall DOWN signal that is not performing to reinforce the overall trend reversal. Into last week it was all coming down to whether the bears could defend the 1.1800 area overall despite the recent buoyant price activity, and that was temporarily not the case. Yet the current weakness back below that area and now the 1.1700 is more bearish once again.

However, unlike the previous minor new high in the US DOLLAR INDEX, EUR/USD was still holding slightly above its 1.1664 mid-August trading low until dropping to the 1.1600 area Fall 2020 trading lows. That leaves the next interim support around 1.1500, yet with the major support not until the 1.1400 area last seen in July 2020. However, on the recent ‘risk-on’ psychology revival it has churned back above the 1.1600 area.

Yet the continued pressure on the non-US DOLLAR DEVELOPED CURRENCIES under the weight of the resurgent COVID-19 pandemic (especially in the UK and parts of Europe) has seen it only churn back up toward the interim 1.1700 area prior to slipping back to no better than the 1.1600 area of late.

**GBP/USD** had already held up much better against the US DOLLAR than other DEVELOPED CURRENCIES in the wake of the Brexit vote finally confirming its exit from the EU. While failing from 1.3500 again in early December, once it recovered the next resistance was not until the 1.3600-50 range it had rallied to in the wake of Brexit agreement prior to reacting back down.

That was back toward the 1.3500 area in January. Next interim resistance was as nearby as the 1.3750-1.3800 area it exceeded into early February, and loosely held on the subsequent selloff.

While this might be in part due to the higher UK interest rates, it is interesting to see how it had evolved in the context of recent US DOLLAR weakness assisting in pushing it above major 1.4000 area congestion since mid-May. That had previously held despite any minor US DOLLAR bounces, also now including weekly MA-9 and MA-13 trend supports.

The next resistances were not until the interim low-1.4200 area it recently tested prior to slipping back below it, and the more major 1.4350-76 congestion that includes the April 2018 nearly five year trading high. Yet in the wake of FOMC moving to a seemingly more aggressive tightening (even if now refuted), it was back below the 1.4000 area congestion with 1.3750-1.3800 area next support that had also been violated after previously being tested and holding.

That had a Tolerance down to the hefty March-April 1.3700-1.3670 area 5-month pullback lows congestion (including weekly MA-41) which had also been recently violated. After the recovery back up to near 1.4000 prior to weakening once again left the 1.3750-1.3800 area reinstated as next support, which has now already violated once again.

That brought the 1.3700-1.3670 area which was violated weeks ago back into focus, with the next interim support in the 135.00 area, and the more major congestion not until the 1.3300 area, The current weakness back below the 1.3750-1.3800 area looks as important as the EUR/USD decision, with the weekly MAs also all in that area meaning it was a significant decision along way to also violating the 1.3700-1.3670 area.

That left important lower support into the 1.3500 area which has already been violated for a fresh 8-month trading low (below the 1.3571 July trading low) prior to the recent bounce, with the next support into the 1.3350 and 1.3200 areas not seen since late 2020. Yet the current return to more of a 'risk-on' psychology has left it back above both the 1.3500 and also the 1.3700-1.3670 areas once again, and even just a bit above the 1.3750-1.3800 area.

Yet the weakening of the non-US DOLLAR DEVELOPED CURRENCIES under the weight of the resurgent COVID-19 pandemic (especially in the UK and parts of Europe) had seen it stall back into that area of late, also with weekly MA-41 at 1.3835. At present it is also weakening back below weekly MA-9 and MA-13 in the 1.3700 area,

The **AUD/USD** early-November through December surge back above .7200, .7350-.7400 congestion as well as interim .7500 area was a strong sigh that led to temporary strength even above the .7650-.7700 resistance the subsequently fizzled. The next interim resistance was as nearby as the recently exceeded .7800 area it was churning around prior to the resumption of recent weakness.

That left lower supports back into the interim .7500 area it previously dipped modestly below and then sagged further below again. The key lower supports are the recently neared congestion in the .7350-.7400 area and the .7200 area once again.

While recent stability had left it back up near .7500 once again, the COVID-19 Delta variant impact had it back down below .7350-.7400 area, with next interim support back into the .7200 but with the major support not until the .7000 area once again (as back in the Fall of 2020.) However, that leaves the current selloff back below the .7350-.7400 area after the failure to reach .7500 next resistance on the rally.

While it was recently back below the .7200 area once again with next support not until the .7000 area, the current rally back above both the .7200 area left it back near the 7350-.7400 area prior to the current weakness. While recently back below .7200 opened the door to the first test of the .7106 August spike selloff low, the recent recovery has it back above the 7350-.7400 area into a test of the .7500 area.

Yet the weakening of the non-US DOLLAR DEVELOPED CURRENCIES under the weight of the resurgent COVID-19 pandemic has seen it stall back into that area, also with weekly MA-41 in the .7540 area it is currently testing. While the pandemic is resurgent in the UK and parts of Europe, Australia has also seen a significant two-month surge in new cases to a record high of 2,744 per day earlier this month, falling to around 1,800 at present.

That is as opposed to April and August 2020 peaks of 400 and 600 respectively. While much lower than many other countries (especially the US and parts of Europe), this still represents a problem for the Northern Hemisphere as it heads into its Winter.

**USD/JPY** was the prima facie example of the extreme mid-February 2020 'haven' bid in the US DOLLAR, as the typical fellow 'haven' currency YEN came under heavy pressure on the USD/JPY surge above 110.00 for the first time since May 2019, leading to an immediate rally to the prominent 112.00-.50 area into the end of that week.

Yet here as well, once the US DOLLAR came under pressure on its loss of 'haven' status due to the COVID-19 spread in the previously safe US, at the end of February it 'crashed' back below the 110.00 area to Close into 108.00 again. Yet that did not hold since early March began on weakness that carried below the interim 106.00 area and once again below the 105.00-104.50 range (39-month trading low with major tests in March 2018, January 2018 and August 2019.)

On recent form it had been previously churning below 105.00-104.50 as recently as January prior to pushing aggressively back above both 106.00 and 108.00 into early March. That it was above both 106.00 and even 108.00 despite US DOLLAR strength is in line with the strength of other DEVELOPED CURRENCIES, and is thereby another 'risk-on' indication.

The bid leaving the other 'haven' currency reinforced the previous secular US DOLLAR weakness on the violation of higher USD/JPY resistance into 110.00 being temporarily violated into early April prior to weakening back down to hold a test of the 108.00 area.

Yet that lack of any 'haven' bid was once again reflected in USD/JPY stabilizing not much worse than the 110.00 area, and now surging up above the 112.00-.50 area with the next resistance into the 114.50-115.50 range tested once again over the past two weeks.

In fact, last week's new 114.69 rally high followed by a lower weekly Close below the previous week's 114.22 Close was a weekly DOWN Closing Price Reversal (CPR.) As with all DOWN CPR's, its Tolerance is that previous week's 114.45 trading high. The lack of any strength in the alternate 'haven' currency indicates the lack of any crisis. As such any continued resilience of the US DOLLAR is more so on secular strength driven by concerns elsewhere.

And **EMERGING CURRENCIES** have now diverged to a greater degree than in recent memory, due to 'country' factors. That has seen the SOUTH AFRICAN RAND recover to a significant degree, while the previously beleaguered TURKISH LIRA gave up its recent bid to weaken to a serious new all-time low. However, in general they remain a good general indication of 'risk appetite' due to their economies' sensitivity to overall economic conditions, and their reversion to weakness has illustrated the degree to which 'risk-off' is now the major psychology.

**SA RAND** had seen **USD/ZAR** failing in early April on renewed 'risk on' psychology violating the next interim support in the 14.70 area (part of the major range from late-2018 through early-2020), even if there was more major support into the 14.50-.45 area it had tested and held back in December through February. While the previous US DOLLAR rallies had seen USD/ZAR ratchet back above the 15.00 area to vigorously test the 15.40-.50 range again, it ultimately reverted to weakness.

That left 14.70 area (in the overall major range from late-2018 through early-2020) next support that had been violated more completely in late March. While that also opened the door for a test of more major support into 14.50-.45 area seen in both December and February, only on the mid-April weakness was that area violated on a weekly Close. Back below the 14.50-.45 area again overall left USD/ZAR nearer to the 14.00 area, and the prominent historic congestion into the upper 13.00s (including the very important 13.81 July 2019 26-month trading low.)

A new round of weakness in late April set in motion to a new 27-month trading low below the July 2019 13.81 trading low. That left the next interim support at 13.55-.50 which was temporarily overrun into early June, and the 13.23 February 2019 33-month trading low as the next major level that was not quite reached.

Yet in the wake of FOMC moving to a seemingly more aggressive tightening, it was back above the 13.80 and 14.00 areas, with next interim resistance into recent 14.20 congestion it also pushed above prior to the recent retest.

Yet more major influence is now likely further COVID-19 Delta concerns. After its inability to sustain weakness back below the 14.20, next resistance was into 14.40-.50 area. That was vigorously tested again of late, and was finally exceeded on South African political violence adding to its already substantial COVID-19 woes.

Even though the violence had abated, the RAND remained weak after a churn around the higher interim area around 14.70 area (with weekly MA-41 at 14.72 at that time.) However, that is with the more prominent recent and historic congestion into the 15.00-.10 area it was recently above, only stopping into the next congestion in the mid-15.00 area.

Yet the renewed risk appetite has been very prominent in USD/ZAR, with the slide since early last week dropping back below 15.00-.10 area, 14.80-.70 and even the 14.40-.50 area, leaving 14.20 once again as the next key congestion (early-August trading low.) While that had held previous, activity back above 14.40-.50 area had left it challenging the 14.70-.80 resistance.

With that violated it has also pushed above the significant 15.00 area congestion. On historic form that did not leave and resistance until recent trading highs in the 15.40 area initially, yet more significantly into the 15.55-.65 area (January and March 2021 trading highs.) That said, the recent drop back below 15.00 left the 14.80 area prominent once again.

Violating that also saw the 14.40-.50 area being vigorously tested. However, the rally that began two weeks ago week has quickly carried back above those levels to see it back above the 15.00-.10 area, and now testing the 15.40-.50 area once again as the next resistance.

Even when other EMERGING CURRENCIES have reacted to the downside of late, the **RUSSIAN RUBLE** had seen **USD/RUB** weaken at times on the back of sustained CRUDE OIL strength. The USD/RUB drop back below 75.00 since late April has seen it even slip below the 73.00-72.50 area prior to the recent recovery back above it.

That recent break was despite US sanctions and the weakness of other EMERGING CURRENCIES in the wake of the previous FOMC announcements and Chair Powell's press conference prior to recovering last week. Lower support is the 72.00-71.75 interim area (albeit still at a 10-month trading low) with the next major support still into the 71.00-70.00 area that was temporarily violated on the combined temporary US EQUITIES weakness and OPEC negotiations disarray.

However, after the recent OPEC disruption USD/RUB was back above 73.00-72.50 area to nearer the 75.00 area prior to weakening once again to retest 73.00-72.50 area. After that held, weakening WTI CRUDE OIL prices had seen it rally back near 75.00 once again prior to stalling.

However, the recent major WTI CRUDE OIL recovery back above 70.00 had seen it drop back slightly below the 73.00-72.50 area prior to stabilizing in that range again. While it pushed up despite general EMERGING CURRENCIES weakness, it was recently back into that range.

Sustained WTI CRUDE OIL strength has left it below that range, with next support into the 71.00-70.00 currently being vigorously tested for the first time since June 2020 and even some early week slippage toward 69.00. While the more major support is into the 68.00 area low from earlier that month, with a weekly 68.66 weekly UP Closing Price Reversal along the way, the current softening of energy markets and general pressure on EMERGING CURRENCIES has USD/RUB back above 71.00-70.00 toward 73.00-72.50.

The **MEXICAN PESO** saw **USD/MXN** selloff after the early-mid March surge quickly violated the lower interim 20.90 congestion, with the interim 20.65 congestion also violated on the way to the broad berth next support in the 20.25 area. That included an important 20.30-.10 weekly chart gap from on the way up in March of last year that had already been violated last November.

It then failed once again into a retest of the additional significant historic congestion (2018-2019) in the 19.80 area, with the next hefty historic congestion as nearby as the recently very vigorously tested 19.65-.50 area. The overall bottom of the very significant late-2018 through early-2020 range is not until the 18.50-.40 range.

That was even allowing there are interesting interim supports at 19.30 and into the 19.00-18.90 range. That said, the current rally back above 19.80 was more critical even after the previous failure as nearby as the 20.25-.30 area. Now slightly back above 20.00 leaves that as the near-term consideration on a weakening 'risk-on' psychology despite what seems to be some support from sustained CRUDE OIL strength.

While higher hefty congestion is the 20.30 area, there is also the higher 20.65 congestion it traded very temporarily above in mid-June prior to weakening below 20.00 again. While next higher resistance is the 20.90 congestion, the focus shifts more so to the 20.00 and 20.30 congestion areas once again after its recent inability to fail on serial tests of the 19.80 area.

Despite the recent CRUDE OIL slippage back below the 75.00-74.00 area leaving USD/MXN weakening back below 20.00, the extended CRUDE OIL weakness below even 71.00-70.00 nearer to 65.00 support prior left USD/MXN back up above 20.00 area to nearer 20.25-.30. However, the restrengthening of CRUDE OIL had USD/MXN back down into the 19.80 area, which it has interestingly held despite the partial return to CRUDE OIL weakness.

Yet the extended energy market drop that had seen it back above 20.00 after recent serial tests of the 19.80 area is now reversed. However, after breaching the recent hefty 20.25 area congestion (also tied into the 20.10 weekly MA-41 at that time) it is back below it. Recently back below the 20.00 area (also weekly MA-9 and MA-13) brought the 19.80 area back into focus prior to the push back above 20.00.

Having now breached the 20.20-.25 area as well as surging above the August 20.45 trading high. The next resistance is the 20.75 June trading high it temporarily exceeded early last week and remains near, with the higher significant congestion above that not until the 21.00 and 21.40-.50 range. Yet while it was a delayed reaction, sustained CRUDE OIL strength had seen it weaken back below the 20.75 and 20.45 levels once again into the 20.20-.25 area. That is also very important on all of the weekly MAs (including MA-41) being just below the 20.20 level, which it has held two weeks ago.

Yet the current weakening of EMERGING CURRENCIES has seen USD/MXN rally back above 20.45 and even marginally above the 20.75 level. That leaves the 21.00 area and the 21.40-.50 range as next resistances once again.

The **TURKISH LIRA** had been back under pressure since **USD/TRY** pushed back above the 8.00 hefty late 2020 congestion back in March. That left the LIRA as the outlier weak sister, with the inability of USD/TRY to drop below 8.00 turning into another bout of strength back above recent 8.20-8.23 short term congestion. While it was slightly below that until mid-April, the recent weaker indication was a late April daily DOWN Closing Price Reversal from 8.3750, which left 8.40 as a general Tolerance that needed to be watched into May. Above that again in line with the other EMERGING CURRENCIES weakening on the temporarily diminished 'risk-on' psychology into mid-May reversed into USD/TRY strength once again.

While that left the door open to a full retest of last November's 8.5146 all-time high weekly Close, with only the 8.5765 coincident all-time high above that. While the LIRA seemed to firm on the mid-May return of the 'risk-on' psychology, that did not even bring a USD/TRY drop back to the 8.23-8.20 range. And while it recently did drop back near that lower interim congestion last week, it was then surging back up to somewhat above the late-May 8.7424 all-time high.

However, there has been a contrarian LIRA rally last week into this week on USD/TRY slipping back slightly below the late-May 8.7424 all-time high. That said, the more important near-term lower support is now the recent 8.52-8.45 area congestion it had slipped below nearer to that 8.23-8.20 range earlier this week prior to recovering into the 8.52-8.45 area once again.

Yet it is now the case that weekly MA-13 and MA-9 have stalled up into the 8.54-8.57 range, reinforcing resistance around that 8.5764 previous major November 2020 all-time high. And the weekly Oscillator indications suggest that it was up against near-term weekly Oscillator thresholds prior to the recent more prominent selloff. While the more critical thresholds (reinforced by previous topping into the minor new highs) were into June's 8.7917 all-time high, those moot after the recent two-month selloff. The subsequent USD/TRY weakness had left it more so down vigorously testing the early-August 8.2960 and early-June 8.2832 trading lows, with the more prominent support down into the 8.00 area (including weekly MA-41.)

Yet the weakening of EMERGING CURRENCIES has seen USD/TRY surge back above the 8.50 area (also still weekly MA-13 and MA-9) and back above congestion around the late-May 8.7424 all-time high. Also now above the June previous 8.79 all-time high sees it up into a 9.1030 new all-time high today. This is also a key weekly Oscillator threshold (MA-41 plus 0.90.)

If it should be exceeded on this week's Close, the rise of MA-41 projected last week's threshold into the 9.30-9.35 area (MA-41 plus 1.05-1.10.) Above that on last week's Close meant the higher Oscillator threshold into this week is not until 9.80 (MA-41 plus 1.51 still rising 0.05 per week) only seen on the November 2020 surge. Having neared it on last week's rally prior to dropping back down to the 9.60 area leaves the 9.85 area as the higher threshold this week.

### **Reports & Events**

While still obviously less relevant (as we have been noting for some time and is most glaringly apparent again at present) on the standard report releases in the midst of more major global trade and political cross currents, the Weekly Report & Event Calendar (accessible for Sterling and higher level subscribers) is available via the [www.rohr-blog.com](http://www.rohr-blog.com) sidebar.

While the end of month data tsunami last week was typically intense, this first full week of November is even more so on some classical key data along with further important central bank rate decisions and press conferences... with some twists. The first is Europe already returning to Standard Time while the US does not do so until next Sunday (November 7th.)

Then there is Monday's All Saints Day holiday in Europe, which sets back both their Manufacturing and Services PMIs by one day (into Tuesday and Thursday.) Wednesday's Japanese Culture Day holiday sets its Services PMI back into Thursday as well. The typical unified PMI releases and responses are going to be unusually disjointed this week.

That said, Monday remains important on the PMIs we will see as well as German Retail Sales and US Construction Spending. Early Tuesday brings the first central bank influences in the BoJ Monetary Policy Meeting Minutes shortly before the RBA Interest Rate Decision and Statement, which is followed by those deferred European Manufacturing PMIs.

Wednesday brings the non-holiday country PMIs (mostly the same as Monday), and quite a bit of European employment data into the US ADP Employment Change prior to Friday's more important US BLS number. Then the early afternoon brings the next FOMC Interest Rate Decision and Statement (only... no projections revisions this time) 30 minutes prior to Fed Chair Powell's post-rate decision press conference at 14:30 EDT.

Thursday sees those holiday-deferred Services PMIs into German Factory Orders, European Commission Economic Growth Forecasts and the BoE Interest Rate Decision along with associated releases that include a Monetary Policy Report this month. Of course that also means Governor Bailey will hold a post-rate decision press conference, which will be followed by quite a bit of US data. Friday brings the RBA Monetary Policy Statement and quite a bit of important Euro-zone data prior to US and Canadian Employment reports, which are followed by a late release (17:00 GMT; 13:00 EDT) of the ECB Survey of Monetary Analysts, October 2021 Aggregate Results... all into the US and Canadian weekend switch to Standard Time.

As noted in much of our recent research, the troubling resilience of the COVID-19 pandemic on the continued Delta variant spread continues to offset more upbeat recent vaccination developments, even the likely US approval of a children's vaccine. Along with that, the recent weakening of the international economy along with higher yields means we are obviously maintaining our recent advice into this week's round of important economic numbers and central bank communication: Keep those seat belts firmly fastened.
