OECD Says 'Not So Fast', Quick Take, Calendar

As we have been alerting since the beginning of the week, today's next monthly Organization for Economic Cooperation and Development (OECD) Composite Leading Indicators (<https://bit.ly/3IDvYge> for our marked-up version) was going to be more important than usual. That is due to the degree to which the previous two months' releases were already indicating growth slowing. For the unfamiliar we always note this is a net four month forward view, based on a six-month projection with a two-month delay to confirm the veracity of the various studies.

Of course, that fits right in with the US EQUITIES forward anticipation, and tends to ignore any minor data anomalies along the way. As such, the 'Not So Fast' is a play on words both cautioning those who have an overly optimistic view into the early part of 2022, and the actual indication for future global economic growth.

Notable in its analysis is, "...signs of a possible upcoming peak in the growth of economic activity in the United States, Japan, Germany and the United Kingdom. Similar signals have now emerged in Canada and the euro area as a whole, including Italy." With similar signs for China (as we have already been noting for some time), the question becomes what specific indications are critical now.

As we have stressed both in and well prior to Wednesday's 'Monte Winner!' research note (repeated below for your ease of access), the Fed is a non-factor now joined by the lowered threat expectations from the COVID-19 Omicron variant. That is after Wednesday's upbeat Pfizer-BioNTech fully boosted vaccine very high efficacy announcement.

That was already the case on Omicron's initial lower observed virulence. As such, our guess of how the Delta variant resurgence plays out in the various global economies seems the way to view the situation now.

As a further note on overall asset class tendencies, it was and now remains most interesting how Wednesday's highly constructive Pfizer-BioNTech announcement defusing the Omicron threat led to a more classical coordinated market response. The strength of US EQUITIES was accompanied by strength in all NON-US DOLLAR CURRENCIES, and weakness in all GLOBAL GOVVIES on the day.

As a reminder, this is after so many recent 'bifurcated' intermarket trend phases for many months reaching back into last year. Yet it seems this 'good news' response also applies to more of the 'bad news' psychology that has returned today.

That is most interesting in the context of the 'rearview mirror' economic releases being rather upbeat over the past several days (especially in the US.) There are reports of US consumer concerns about early 2022, yet also with indications they are planning robust holiday spending.

With such seemingly constructive economic background, why are the US EQUITIES weakening, the US DOLLAR INDEX getting some 'haven' bid back after the latest dip back near the 95.70 key low end of its recent churn, and the GLOBAL GOVVIES which had weakened so much on Wednesday recovering so nicely? It has been highly problematic for months to rely on the US EQUITIES as a bellwether of the overall 'risk-on' psychology, as they have often remained resilient while other asset classes reflected more of a 'risk-off' psychology.

While they have succumbed as well at times, they have not led from the front on any shift to more of a 'risk-off' psychology. However, with the current seemingly synchronized trends, we will look at them for the overall tone after this week's extension of their recent major recovery stalled in the key resistance.

As also reviewed in Wednesday's 'Monte Winner!' research note (and early week analysis), MARCH S&P 500 FUTURE (front month future on December 17th) at a \$7 discount to the December contract has only tested the key 4,694.50 weekly DOWN Closing Price Reversal (CPR) from two weeks ago. That has a Tolerance of the previous week's 4,723.50 just previous all-time high. On recent historic form, even a market that came back over \$200 from the Omicron scare 4,492 front month future trading might still manage to stall into resistance.

As noted above, today's selloff is reinforced by strength in NON-US DOLLAR CURRENCIES and the GLOBAL GOVVIES significant rebound. Whether today's incipient 'risk-off' indications continue will likely depend on the forward view that is going to be at least partially determined by the public sentiment regarding the resurgent Delta variant. The key there will be whether there is any significant reversion to 'gathering' economy aversion if the news becomes much worse in the near-term.

While there is a bit of 'good' news today in Tuesday's drop back to 'just' 119,895 CDC reported US New Cases from Monday's explosion to 190,298, the rest of this week remains a very critical horizon. That is on the full indications for how bad any Thanksgiving travel and gathering surge might become in the key two weeks later time frame. As noted, Monday might have been some typical 'catch-up' from the lighter weekend reporting, as we saw during much of November. However, if the new cases remain elevated back toward 200,000 later this week, it's a problem.

Courtesy Repeat of Wednesday's 'Monte Winner!' research note

Well, for at least part of our multifaceted assessment of what to look for in the late-year market psychology, it seems we had guessed right. Once again like the degree to which our skepticism of the 'risk-on' psychology got an unexpected boost two weeks ago from the Omicron new COVID-19 variant news, there was a not totally unexpected bit of positive news this morning:

The Pfizer-BioNTech announcement that their 'boosted' vaccination was effective against the new Omicron variant. CNBC interviewed Pfizer CEO Albert Bourla (<https://cnb.cx/3yerAzq>) this morning on the specifics of what its most recent studies have told us (with further results pending into the end of this month), and it is worth reviewing for more details. Overall, this is undoubtedly great epidemiological news, and we should all be very happy.

We also picked the right card in terms of the overall 'reopening' versus 'resurgence' psychology, insofar as Omicron really doesn't mean much. As we extensively explored in Tuesday's 'Variant Three Card Monte' research note, (to paraphrase a recent Scott Gottlieb quote) "...Delta never went away." Which is as we have counseled since late October, and continued to advise regarding the nominally weak US New COVID-19 New Cases reporting from the CDC into and after the heavy Thanksgiving travel and gathering weekend.

As revisited again in Tuesday's analysis (repeated below along with other assessments), the real key will be the levels into later this week. That should provide more of an impact on the US and global economy from Delta than Omicron ever likely will.

And here comes the full week later (the key timeframe) post-Thanksgiving CDC US New Cases graph (<https://bit.ly/3lzzckz>), with its indications that the heavy travel and gatherings might have indeed triggered another massive surge. It is possible that this is the sort of 'Monday catch-up' after the weekend seen through much of November.

Yet that was not the case last week, and anything less than an implosion in new case levels from Monday's explosion close to near the 200,000 level peak back in early September will not look very good. Once again, especially consider the 65,000-70,000 Daily and 7-Day Average New Case level they never dropped below in late October, and that is with the 7-Day now back up to 117,000.

And in the context of protection against Delta variant or even the latest hopeful indication on the ability to counter Omicron with full 3-shot boosted vaccination, the weak overall US vaccination levels likely remain a problem. While we have recently highlighted some key aspects, there was a CNBC graphic this morning on the major metrics (<https://bit.ly/306BDtH>).

While a surge in vaccinations has occurred in the wake of the Omicron scare, it is still only 60.1% fully vaccinated. That remains a very weak level compared to the other developed economies, especially Europe.

In the context of the rightfully upbeat reporting on the Pfizer announcement this morning, it is important to recall that this was for the 'boosted' vaccination that is only possible for the 60.1% of US individuals who are fully vaccinated. It is also the case that the additional 11.0% who have had just one dose will need both their second dose and the months long waiting period (for Pfizer and Moderna mRNA vaccines) prior to being 'boosted'.

That leaves quite a bit of vulnerability for them and the US 'gathering' economy, which might see public sentiment weaken again. While we hate playing Cassandra, this warning is especially necessary at this time due to the recent major improvement in the 'risk-on' psychology driving US EQUITIES higher, and being reflected in other asset classes as well.

As we noted in Tuesday's analysis, for all of the Fed fixation, it remains a fairly minor influence. That is due to the degree to which any QE 'taper' acceleration will only occur if the US economic reopening and recovery remains strong. And in that case tightening by the Fed may become a counterintuitive sign of strength for the markets.

The other key 'card' is the actual economic performance, which has seen some weakening of the data of late in Europe and Japan even as the US remains strong overall. However, the current post-Thanksgiving period is likely a significant indication for future public sentiment on the 'gathering' economy (dining, travel, hospitality, etc.) into the key Christmas holiday period.

As such, we will continue to closely monitor both the CDC New US COVID-19 Cases and any public response (as indicated by reports from those industries) to see if the major services sector rebound will indeed continue into late this year, or abort at least in the near term.

As far as market psychology, while the US EQUITIES have strengthened markedly, the MARCH S&P 500 FUTURE (front month future on December 17th) at a \$7 discount to the December contract is still near the key 4,694.50 weekly DOWN Closing Price Reversal (CPR) from the 4,740.50 new all-time two weeks ago. That has a Tolerance of the previous week's 4,723.50 previous all-time high (see below for more details.)

The operative question is whether a market that came back \$200 from the Omicron scare 4,492 FRONT MONTH FUTURE trading low might still manage to stall into resistance created during the early part of that scare? On historic form the answer is “yes”, at least temporarily based on many recent market swings.

And what of the weakening of the US DOLLAR INDEX against DEVELOPED CURRENCIES along with the strengthening of EMERGING CURRENCIES? Again, this is reasonable on the resumption of ‘risk-on’ psychology into the resumption of the ‘reopening’ trade on reduced psychological stress from less of an Omicron threat.

Yet it is the case the Delta impact is still out there and looking to possibly worsen, which will be the more telling card the market Three Card Monte dealer will be playing. It is possible however that the US DOLLAR will not benefit as much as in a typical global crisis, if indeed the level of stress seems greater in the US than elsewhere.

And what if the weakening of GLOBAL GOVVIES on today’s positive Pfizer Omicron news? Second months (March) of the T-NOTE and especially the GILT are indeed into or below some key support (T-NOTE 130--00 and GILT well below 128.00) on their discounts to the December contracts. However, their expirations are still quite a ways off (T-NOTE on the 21st and GILT not until the 29th), and their trend decisions still leave room to be affected by the further evolution of the pandemic.

And while dropping quite a bit today, the MARCH BUND FUTURE is only backing off from near its 175.00-.50 resistance. And it is still well above 172.50-173.00 historic congestion the December contract stalled into prior to today’s typical early-month expiration.

Courtesy Repeat of Tuesday’s ‘Variant Three Card Monte’ research note

It seems there is another round or ‘risk-on’ psychology reasserting itself at present, with the DECEMBER S&P 500 FUTURE back above the 4,621 major ‘swing count’ Objective after churning below it for the past couple of weeks. Just to be clear, we have always noted this is more so an overall level, and was not to be used as any sort of near-term trend decision level. There are other more telling Evolutionary Trend View (ETV) indications which are critical in the current trend.

What is clear for now is other asset classes that led the possible restoration of any full ‘risk-on’ psychology are now stalling. This gets back to a bit more of the ‘bifurcation’ which was so evident on some previous US EQUITIES rallies while other markets languished or weakened. Prior to getting to the ‘macro’ psychology alluded to in today’s title, here is our review of the most critical US EQUITIES ETV dynamics, even on a further rally. The key is likely the 4,694.50 weekly DOWN Closing Price Reversal (CPR) from the 4,740.50 new all-time two weeks ago.

That is from the previous week’s Close, and has a Tolerance of the previous week’s 4,723.50 previous all-time high (highlighted in the weekly chart through Friday <https://bit.ly/3rFcsd3>.) With DECEMBER S&P 500 FUTURE already above the interim 4,660 congestion, those become the key levels to watch on the improved ‘risk-on’ sentiment. We will revisit the psychological alternatives below, yet note weakness late last week reinforced the DOWN CPR psychology, and may mean it remains a telling hurdle for any return to more ‘risk appetite’.

That background on the ‘Variant Three Card Monte’ has to do with just how much overall market proclivities, with alternative outcomes on pandemic resurgence and other factors, makes for a challenging guessing game. For the uninitiated, classical hustler’s scam on cheating targets with an unwinnable choice in a playing card version of the classical ‘shell game’ (for more please see the WIKI: https://en.wikipedia.org/wiki/Three-card_Monte.)

The difference here is that there is a way to mostly figure out the right 'guess' on what factors are going to be the most dominant near-term and intermediate-term market influences through this month. The first is the pandemic itself, where we have previously noted hyperventilation over Omicron, while it has been only passingly mentioned that US New COVID-19 Cases have been rising once again.

We once again share the updated CDC graph (<https://bit.ly/3opy235> as of Friday), which shows an interesting new cases rise from 100,000 to 150,000 right after Thanksgiving holiday suppressed reporting.

As we had warned on that holiday suppressed reporting, while the 7-Day Average looked weaker during that period, that was part and parcel of the lower reporting rather than any organic improvement. As we expected, that has moved back up as expected higher post-holiday postings caught up later last week. While it has dropped back into the daily 40,000 level, that is typical for lighter weekend reporting loads.

As noted repeatedly of late, the bigger issue will be what that shows into the post-Thanksgiving travel and gathering new cases into especially the later part of this week. Maybe there will be miraculously lower new cases after major travel. However, on past form for all US holidays in addition to all of the 'normalcy bias' that has seen recent major unprotected gatherings for sporting events, in dining and hospitality as well, this would be indeed miraculous.

Which is why part of the 'Variant Three Card Monte' consideration is whether Delta or the new Omicron variant will be the most critical for the future pandemic path. News organizations can be partly excused for the Omicron focus, as it is the 'news' right now. However, informed sources have already told us that the resurgence of Delta is likely the far more major development in the northern hemisphere Winter we are just entering at present.

This is only reinforced by still low US vaccination rates. Only just having achieved the 60% level leaves it vulnerable to a sustained rise in new infections. Anecdotal indications that Omicron is less virulent despite being more transmissible are of little comfort if Delta is fully resurgent.

In that regard we pick Delta as the real issue which is facing the currently more confident 'reopening' trade that is driving US EQUITIES' upbeat rebound. It is after all the economy, and especially the outlook into the later part of the Winter, will ultimately driving the near-term trend.

While the US and global economy is the second choice in the potential 'Monte' decision, that is more problematic under consideration of a major pandemic resurgence which might affect the 'gathering' economy despite many folks' desire to shed any pandemic suppression steps.

This gets to the third card facing the markets under the 'Monte' selection: the Fed, and its removal of extreme accommodation. This is likely the least critical for any bullish US EQUITIES trend, as the Fed is a 'self-adjusting' influence. Note how quickly the yields dropped into the Omicron influence despite no indication from the Fed this would affect its QE 'taper' plans.

While that might have been inferred, the Fed did not need to say anything. And in the scenario where the economics find a way to not lose momentum under any pandemic resurgence (not our most likely scenario), the markets can likely tolerate any lower Fed accommodation.

So the bottom line is the Delta variant, and any current significant resurgence which suppresses public 'gathering' economy affinity, is the most likely winning card in deciding the right choice for 'Variant Three Card Monte'. Not necessarily the obvious choice, yet the most critical at present into at least later this week. This is reviewed in Friday's 'Problematic Data and Outlook' research note.

The other ETV tendency to watch closely is the global govies, as they are back under pressure after the immediate bullish (i.e. lower yield) Omicron influence is waning on recent less dire anecdotal influences. Of special note is Wednesday's typically early FRONT MONTH GERMAN BUND FUTURE expiration. As previously noted, the MARCH BUND FUTURE is trading at almost a full 2.00 premium to the expiring December contract. That leaves it at 174.40, well above the 172.50-173.00 area lower congestion. These significant premiums or discounts in the second month Bund into expiration are clear signals of how the psychology is shifting into the next quarter's outlook. At present it is not very bullish on the global economy.

Courtesy Repeat of Previous Quick Take (updated chart)
[S&P 500 future ETV in today's macro; to be updated after Friday's inflation data]

After the early July downside reaction the recovery back above the 4,300 area violated support left the higher resistance into the previous week's 4,360 DOWN Closing Price Reversal with a Tolerance to 4,364. That is clear on the FRONT MONTH S&P 500 FUTURE weekly chart (<https://bit.ly/3rFcsd3> updated through Friday.) It is of note the SEPTEMBER S&P 500 FUTURE had managed to retest that area right into the ECB press conference prior to weakening once again the following Thursday morning.

And the SEPTEMBER S&P 500 FUTURE subsequently sustaining activity above the 4,425 and 4,450 weekly Oscillator thresholds was a sign of continued strength as they were still rising \$25 per week. As such, the Oscillator indications remained important after what was the 'lackluster jailbreak' after the previous outstanding US Employment report. With the market dropping back below the 4,450 level, there seemed to finally be some real risk.

Yet even below the key lower interim levels into the recent 4,425 area congestion and 4,380-65 area bottom of that, it also held key lower support in mid-August looking forward into the following week. That bigger level was 4,340 on weekly MA-13 (loosely held on all sharp reactions) at that time, and the significant aggressive weekly UP Channel from the major 2,174 March 2020 cycle low.

In the event, the recent late week recovery back above the 4,425 area pointed to the strength of the psychological recovery as well as exceeding the key technical resistance areas. That led to the recent new all-time highs above the previous week's 4,476.50 trading high (prior to the temporary selloff.) That again left the near-term Oscillator thresholds into 4,515 and 4,540 areas (on the rising MA-41), which it failed to maintain in early September, fomenting the reaction.

This led to the SEPTEMBER S&P 500 FUTURE violation of the 4,492 interim daily chart congestion after trading around it previous, with the more prominent 4.462 area also being violated two weeks ago. And while it traded back above that as well early last week, recent softening below it spoke of an ability to trend lower in the near term.

That left the more major 4,420-10 area as next support on both weekly MA-13 as well as that significant aggressive weekly UP Channel from the major March 2020 low. Having tested that area into the mid-September Close and violating it from the beginning of the following week was a fresh 4,410 DOWN Break. That fed further weakness which was already anticipated from the negative influence flowing out of China.

As usual there was a Tolerance below that (as seen on selloffs in both June and July) down to 4,350 area lower congestion developed during the temporary July topping activity, and retested on the mid-August sharp temporary reaction to a 4,347.75 trading low. While that seemed a broad berth, on past form only below the 4,350 area does it signal a full trend reversal.

Yet as always with these matters, the weekly Close was more important than temporary trading weakness below it. And the DECEMBER S&P 500 FUTURE held against interim low-4,300 support, and ended the week back above the low 4,400 area. The extent of the temporary selloff means that it needed to be treated as a 4,410 weekly up channel DOWN Break.

Yet that also means the Close back above it established it as a Negated DOWN Break, and therefore a support area. That is also consistent with weekly MA-13 moving up to the 4,430 area this week. That said, the 4,348 area had reverted to the key support again on the then renewed pressure. And much like previous, it was temporarily violated.

The difference is that the daily 'trend flow' was quite a bit different with the rally back above the low-4,400 area. Holding above the 4,430 area Tolerance of the 4,400-10 resistance for a weekly Close also above the at that time weekly MA-9 and MA-13 in the 4,435-45 area looking more bullish again. The next higher resistance was at the 4,472 late September trading high from which it previously dropped to the 4,300 area. That being exceeded last week was a further strong sign, which has not surprisingly led to the DECEMBER S&P 500 FUTURE also pushing above the next minor early-September congestion in the 4,510 area.

That only left the early September 4,549.50 front month S&P 500 future all-time high as resistance After that was exceeded, a 4,621 major 'swing count' was the next key threshold, with the next key weekly Oscillator thresholds up into 4,725 and 4,750 last week.

After stalling into them early last week, there was finally a reaction that was still only down to 4,660 interim support Wednesday. However, Omicron news into Friday immediately knocked it back below that area to below the 4,621 previously exceeded upside Objective. After Monday's rally back up to 4,660 failed it dropped closer to interim 4,535 support prior to rallying back into the 4,621 area; which will all remain very interesting into the end of this week.

***Courtesy Repeat of Previous Evolutionary Trend View (Same charts)
[To be updated Friday after German and US inflation data]***

While the **FRONT MONTH T-NOTE FUTURE** (March at the time) contract had not really challenged the mid-low 132-00 area support, the discounted JUNE T-NOTE FUTURE was only back to trading somewhat above it (as apparent on the weekly chart through a week ago Friday <https://bit.ly/3cYfFf0>.) The next key decision into mid-low 132-00 area was the March contract expiration after the JUNE T-NOTE FUTURE failure on the rally into that area.

Even as it recovered then, the bounce back above that area had failed again, with the lower support still down into the interim 130-00 area, and major support not until 128-00 area (2019-2020 congestion.) Yet the subsequent sanguine Fed attitude along with COVID-19 Delta variant concerns seemed to be supporting JUNE T-NOTE FUTURE in its recovery back above 132-00. That opened the door to the retest of the historically prominent 134-00 area seen of late.

However, the quarterly expiration saw the SEPTEMBER T-NOTE at a typical full point discount, even if it recovered nicely from recent activity back below the 132-00 area once again on the FOMC fears. While that should provide comfort to the bears, it was also a risk they could rally to retest the 134-00 area if they did not remain below 132-00. That recovery has transpired in the context of the recent COVID-19 Delta variant spread, with a rally well above 134-00.

That it is also still likely abetted by the consistent FOMC commitment to continued bond purchases, which has led to the push above the 134-00/-16 congestion from March 2020, with the next resistance as nearby as the 135-00 area into recently tested weekly MA-41 that has now dropped to the upper 134-00 area. Yet the more major DOWN Channel resistance (from the 140-235 March 2020 all-time high) is not until the mid-136-00 area.

However, in the wake of all of this inflation pressure, the SEPTEMBER T-NOTE FUTURE was holding in the mid 133-00 area. That is still only a bit below the 134-00/-16 area it subsequently traded above, and still well above the key lower 132-00 area it recovered above after slippage in March and repeated tests through June. This is all the more interesting as the pressure on the other GLOBAL GOVVIES seems to stem in part from US inflation indications.

And the SEPTEMBER T-NOTE had finally been weakening a bit below the 134-00 area, even if only slightly up until its September 21st expiration. However, even after the recent bounce, the DECEMBER T-NOTE FUTURE was still at a 24/32nds discount. That left it down into the low 133-00 area, and slipping for a vigorous test of the more important 132-00/131-16 area.

As noted previous, DECEMBER T-NOTE FUTURE weakness is particularly telling both in the context of how quickly it weakened into that area, and the next historic support not being until the 130-00 area. That is allowing that the previous sharp selloff into early April held at 130-255, essentially not any sort of historic congestion.

After a brief mid-October rally, it had finally weakened below that level and was at new lows after not being able to Close back above it on an interim rally. Yet some combination of negative sentiment factors, such as the recent serial weak economic releases and COVID-19 resurgence, had rallied it back up to the 131-00 area prior to stalling once again.

That said, the previous selloff was consistent with a 10-year yield swing to 1.66%, as expected. That was near levels seen during the April-May 1.70-1.75% range surge. The next support below the 130-00 area is not until the more major congestion area at the low end of the August 2019 through February 2020 range in the 128-00 area, which would be consistent with yields above the 1.70-1.75% range.

However, the recent rally that was exacerbated by a more dovish than expected BoE two weeks ago Thursday sent it back up to a test of the 132-00 are. Yet the subsequent US and other countries' inflation data had it back down near 130-00 prior to stabilizing. However, the recent strong data and inflation indications have dropped it to a new trading low for the overall selloff below that level. While that opened the door to a test of the next lower and very major support in the 128-00 area, the Omicron news saw it surge back above 130-00 and even see a test of the major 132-00 resistance prior to coming back under pressure again.

While the **MARCH BUND FUTURE** remained above 173.00-172.50 congestion, as expected it was a bit demoralizing that the JUNE BUND FUTURE was so far below it when it became front month future (seen in the weekly chart through a week ago Friday <https://bit.ly/3p76VJr>.) That left it more so poised to retest the 170.50-169.75 area congestion that had reached prior to the current recovery rally, with the far more major lower recent and historic congestion in the 168.86-.00 area from the summer 2016 previous all-time high.

However, it was more important on the previous recovery whether it could once again sustain activity back above the 173.00-172.50 congestion. Yet after only rallying into that area on the recent general GLOBAL GOVVIES recovery, this previous weak sister had been back under pressure toward 170.50-169.75 area congestion on stronger European inflation indications despite rallies on central banker assurances regarding inflation.

Even its previous recovery from temporary slippage below 170.50 left it only up into the existing 173.00-172.50 congestion once again. While that leaves a long way back down to the key recently tested 170.50-169.75 area, even after fading from the contrarian FOMC bounce it was only somewhat back below that 173.00-172.50 congestion.

And that lack of any downside momentum left it hanging around the low end of that important 173.00-172.50 congestion of late, with the recent recovery back above 174.00 looking more so like a retest of the 175.00-.50 area was possible under the influence of the recent COVID-19 Delta variant spread. After that even that resistance had been exceeded on the extended Delta variant influence, with next congestion back in the 177.50-.00 congestion area that has been vigorously tested in recent trading. Next resistance was as nearby as 178.00 congestion, yet with the extended level in that area being the 178.77 December trading high, and its gap lower from the 178.68 high Close that same week.

On the current return to weakness below 177.00-.50 area the key lower remains the 175.50-.00 area it pushed above in mid-July after a more telling rally above the 172.00-.50 area. Yet it was now already back down into the low end of the 175.50-.00 range. While holding might have given some folks a sense of support, that was also violated into early this week.

And that was only the prelude to today's SEPTEMBER BUND FUTURE typically early month expiration with the DECEMBER BUND FUTURE trading at a full 3.00 discount. And that is with the December contract also below the 173.00-172.50 area, which seems to point to quite a bit of inflation expectation there. It also points to the potential test of the next major 170.00-169.50 congestion unless there is a recovery back above the 173.00-172.50 area. And on the recent rally it only reached the 172.00 area, leaving it vulnerable to renewed pressure.

That said, previous downside leader DECEMBER BUND FUTURE Monday drop into its major 170.00-169.50 range key support has not seen any further weakness so far. The overall drop represents a yield rally to -0.20%. While that may sound quite low to others, it is well up from nearly -0.50% as recently as mid-August. Its importance is highlighted by this being the key support this side of the 168.00-167.50 range. However, much like the T-NOTE, its selloff into May did not quite reach that area.

It was then dropping very near that lower support after avoiding it previous, and was more critical on the recent weakness into the interim 170.50 support level. Yet having held that into mid-November, it was into a strong rally on the Omicron influence back up in the 172.50-173.00 area. Stalling there once again of late might not be such a major problem in light of the typical early quarterly futures expiration.

The MARCH BUND FUTURE is currently trading at 173.82, which is a 1.70 premium to the December contract. Radical premiums and discounts are the norm for the 'SECOND MONTH' BUND FUTURE whenever there is a shifting future sentiment; as opposed to typical modest discounts in the T-NOTE and GILT FUTURE expirations.

Therefore, barring any sharp 'macro' psychological improvement (not very likely) by next Wednesday, the burden of proof will be on the bears to knock the MARCH BUND FUTURE back below 173.00-172.50; which currently still feels like a long way down.

As the co-downside leader the **MARCH GILT FUTURE** (possibly on the inflationary implications of the Brexit break with the EU) was already failing somewhat below major 130-00 congestion. That was also with the typical full point discount in the **JUNE GILT FUTURE**. That left next support into the mid-low 128.00 area it was recently below prior to rebounding.

Even though back above it once again, it remained vulnerable along with the rest of the GLOBAL GOVVIES. If it should slide further, the next major supports are not until the 126.50 and 125.50-.00 areas. Yet central banker assurances inflation will be transitory had it recently rallying back into the upper 128.00 area of late.

While the prominent resistance remains in that 130.50-.00 range congestion (violated previous 22-month trading lows), weekly chart congestion, MA-13 and the gap down from the March contract expiration all pointed to resistance in the low-mid 129.00 area into which it indeed stalled into early June.

And the GILT FUTURE expiration saw the opposite picture from the premium in SEPTEMBER BUND FUTURE. The **SEPTEMBER GILT FUTURE** was actually a typical full point below the June contract when it expired. While it was recently back down below the 128.00 area, we ascribed this to the economic differential between the previously fully reopened UK economy versus some residual drags in Europe.

While recently only modestly back above the 128.00 area, the current rally under the influence of recent UK COVID-19 Delta variant spread had it back up into to the 130.50-.00 range prior to recently backing off. It is interesting that even as the Delta variant continues to impact the UK and global economy. In that regard, the GILT not rallying any further than a retest of the high end of the 130.50-.00 area was a warning, even if it was maintaining that rally into higher resistance until the recent return of pressure.

Yet on the recent weakening back below 130.50-.00 area the next support remains 128.00. While quite a ways off, the September contract expiration currently sees a **DECEMBER GILT FUTURE** that is already trading down below that lower congestion, and closer to the major 126.00-125.50 major congestion prior to the recent bounce.

That said, as the FRONT MONTH GILT FUTURE had been the weak sister previous, it failed to hold its 128.00 support on the September contract selloff. With the typical full point discount at expiration in the 'second month' DECEMBER GILT FUTURE, it was back to well below its 126.00 support. That is striking in being so far back below the 126.86 May trading low (March-May high yields near 0.90%), and insofar as the cash rate is now slightly above the psychologically important 1.00%.

The next futures support was not until the recently tested low 124.00 area. Any sustained weakness below that area (which is developing at present) points to interim congestion in the 123.00 and 122.00 areas, yet with the major low end of the full 2018 range (it is already sagging into) not until the 120.00 area (weekly MA-41 minus 9.00!!)

As such, even considering how far GLOBAL GOVVIES prices have fallen and yields have risen, the 'straight-line' factor means that if the current support fails they may have further to go prior to any stabilization or counterpoint reaction. That was very interesting of late as it scrambled back above to the 124.00 area after previously weakening below.

And here as well some combination of negative sentiment factors, such as the recent serial weak economic releases and the COVID-19 pandemic resurgence, had rallied it back above the 126.00 area failed support. That was exacerbated by the recent less hawkish than expected BoE pushing back it up near the interim 127.50 March-June congestion, with the more considerable congestion (and weekly MA-41) up into the 128.00 area. After recent stronger economic data had it slipping fully back below the 126.00 area early last week, the Omicron news saw it spoke up near the 128.00 area (also important now as weekly MA-41.)

In **FOREIGN EXCHANGE** the **DEVELOPED CURRENCIES** had also seen massive shifts from the Spring of 2020 prior to quieting down once again. As noted extensively throughout the year, even though the **US DOLLAR INDEX** had a 'haven' bid into mid-February 2020, it then came under extensive pressure against the other **DEVELOPED CURRENCIES** on the more upbeat global recovery outlook on the COVID-19 vaccination success despite near-term setbacks.

However, recent problems elsewhere and the stronger US economic data and corporate earnings have developed into a 'haven' bid in the greenback.

Yet the previous higher yield anticipation was driving the 'risk-off' psychology in the vulnerable EMERGING CURRENCIES on a 'country' basis, even if a resilient if quieter US DOLLAR 'haven' bid had survived a modest rally in the DEVELOPED CURRENCIES. It currently seems prospects are better in the US than the rest of the world despite the US still having an elevated COVID-19 new case rate. That has led to the US developing a nominal yet curious 'haven' bid into a new 16-month high... possibly also in part as the 'least bad' alternative.

After the **US DOLLAR INDEX** had failed to remain out above the 91.00-.23 range in recent trading, next lower support in the 91.00-90.50 area was violated prior to the previous squeeze above that area (as seen on the weekly chart <https://bit.ly/3xD4wKb> through a week ago Friday.) That still left historic 89.50-.00 area support tested during December through February and just missed in late May as lower support.

Yet in the wake of FOMC moving to a seemingly more aggressive tightening, it was back into 92.30-.00 area once again, which it had recently overrun. While the recent focus was back on 91.00-.50 area (including weekly MA-41) that it could not weaken back below of late, the higher interim resistances above the 92.00-.30 range are into the already violated 92.60.

That is along with the recent fresh major weekly 92.70 down channel UP Break (see the chart.) While recently slightly above the next congestion in the 93.30-.40 area (including the March 93.43 8-month trading high), back below it the 92.70-.60 area was a key consideration.

Failing below it prior to the current recovery was a negative sign which has been mitigated on the rise back above it. Whether that maintains, and whether it can invigorate stronger activity back above the 93.30-.40 area will be the key current trend indications. Yet the market activity is clear on the US DOLLAR INDEX rising above 93.40 area once again.

Also above the August 93.72 trading high makes this a new 10-month trading high, with next resistance not until the 94.30-74 Fall 2020 trading highs. The recent weakening of the US DOLLAR 'haven' bid left it struggling to hold the 93.70 area once again, yet which it then recovered back above.

Yet the weakening of other DEVELOPED CURRENCIES under the weight of the resurgent COVID-19 pandemic (especially in the UK and parts of Europe) had seen it to only slip quietly below that area prior to the recent recovery. The current 'haven' bid looks more so like a 'shift into the least bad' bid into what may be another global weakening.

Yet above the major 94.74 16-month high the next resistance was not until 95.74 that has already been exceeded with the low-mid 96.00 area above that violated last week as well prior to the curious Omicron selloff. That has left it churning between the 96.50 and 95.70 areas on the vagaries of what the Fed has had to say about inflation and the likelihood of any accelerated 'taper' potential. While we are not fans of the central banks and short-term rates controlling the FOREIGN EXCHANGE trends, there seems to be a bit of that at work in the markets right now.

With **EUR/USD** below 1.2000 again, there seemed to be more of a 'risk off' psychology again into early March, which was then independent of the strength of EMERGING CURRENCIES. Lower supports were back down into those 1.1815 and 1.1700 areas. That reinforced the potential for more US DOLLAR strength.

The next lower EUR/USD support into 1.1815 had been violated in late March, with next support into the 1.1700 area subsequently tested prior its subsequent rapid push back above the 1.1800 area.

That was extended as EUR/USD rallied above 1.2000 again, and even churned above the top of the 1.2000-1.2100 range prior to temporary slippage back below the top end of that range in recent trading. The next significant resistance above is back into the recently tested 1.2200-50 area at the bottom of the early 2018 major range, with next resistances above into the 1.2400 area interim 2018 congestion, and 1.2550 top of that range.

Yet in the wake of FOMC moving to a seemingly more aggressive tightening (now refuted), it was back below 1.2000-1.2100 range with 1.1900 area interim support being violated overall on the way to the current weakness below the 1.1815 interim support. That left the 1.1700 area more major lower support, which correlates well with the US DOLLAR INDEX 93.30-.40 area.

While much below that the next more major support is not until the 1.1600 area, the recovery back above the 1.1815 interim support meant that was once again the area to closely watch. And the recent sharp failure put the 1.1750 area back in play as a weekly Head & Shoulders H&S) Top Neckline (as on the weekly chart through a week ago Friday <https://bit.ly/2ZyHNIY>), which it quietly slipped below on a fresh 1.1800 DOWN Break.

Does that mean the 1.1100 Objective will be hit? Well, long before that would happen it will be important to see if it sees greater weakness below the important late-March 1.1700 area trading low than the temporary weekly Close slightly below it two weeks ago.

That is the low between the Head (H) and Right Shoulder (RS), the violation of which is always a key indication of whether the H&S Top is a bona fide pattern reversal, and fulfills at least the minimum bear trend definition of a "lower low after a lower high" (as the right shoulder by definition always is.) Yet on current form, the sheer 'trend flow' for the past several weeks looks bad for the bears.

Having a sizable weekly pattern DOWN Break show some progress only to not exhibit downside 'follow through' on the subsequent selloff felt like that overall DOWN signal that is not performing to reinforce the overall trend reversal. Into last week it was all coming down to whether the bears could defend the 1.1800 area overall despite the recent buoyant price activity, and that was temporarily not the case. Yet the current weakness back below that area and now the 1.1700 is more bearish once again.

However, unlike the previous minor new high in the US DOLLAR INDEX, EUR/USD was still holding slightly above its 1.1664 mid-August trading low until dropping to the 1.1600 area Fall 2020 trading lows. That leaves the next interim support around 1.1500, yet with the major support not until the 1.1400 area last seen in July 2020. However, on the recent 'risk-on' psychology revival it has churned back above the 1.1600 area.

Yet the continued pressure on the non-US DOLLAR DEVELOPED CURRENCIES under the weight of the resurgent COVID-19 pandemic (especially in the UK and parts of Europe) has seen it only churn back up toward the interim 1.1700 area prior to slipping back to no better than the 1.1600 area of late.

This has now led to the further weakening below the previous recent 1.1524 trend low, with the 1.1400-1.1370 area below that now also violated. That leaves next support not until the currently tested 1.1200 area with 1.1000 below that, and the H&S Top 1.1090 Objective along the way. While the Omicron influence has seen a squeeze, that has not even carried up to the 1.1400-1.1370 area so far.

GBP/USD had already held up much better against the US DOLLAR than other DEVELOPED CURRENCIES in the wake of the Brexit vote finally confirming its exit from the EU. While failing from 1.3500 again in early December, once it recovered the next resistance was not until the 1.3600-50 range it had rallied to in the wake of Brexit agreement prior to reacting back down. That was back toward the 1.3500 area in January. Next interim resistance was as nearby as the 1.3750-1.3800 area it exceeded into early February, and loosely held on the subsequent selloff.

While this might be in part due to the higher UK interest rates, it is interesting to see how it had evolved in the context of recent US DOLLAR weakness assisting in pushing it above major 1.4000 area congestion since mid-May. That had previously held despite any minor US DOLLAR bounces, also now including weekly MA-9 and MA-13 trend supports.

The next resistances were not until the interim low-1.4200 area it recently tested prior to slipping back below it, and the more major 1.4350-76 congestion that includes the April 2018 nearly five year trading high. Yet in the wake of FOMC moving to a seemingly more aggressive tightening (even if now refuted), it was back below the 1.4000 area congestion with 1.3750-1.3800 area next support that had also been violated after previously being tested and holding.

That had a Tolerance down to the hefty March-April 1.3700-1.3670 area 5-month pullback lows congestion (including weekly MA-41) which had also been recently violated. After the recovery back up to near 1.4000 prior to weakening once again left the 1.3750-1.3800 area reinstated as next support, which has now already violated once again.

That brought the 1.3700-1.3670 area which was violated weeks ago back into focus, with the next interim support in the 135.00 area, and the more major congestion not until the 1.3300 area. The current weakness back below the 1.3750-1.3800 area looks as important as the EUR/USD decision, with the weekly MAs also all in that area meaning it was a significant decision along way to also violating the 1.3700-1.3670 area.

That left important lower support into the 1.3500 area which has already been violated for a fresh 8-month trading low (below the 1.3571 July trading low) prior to the recent bounce, with the next support into the 1.3350 and 1.3200 areas not seen since late 2020. Yet the current return to more of a 'risk-on' psychology has left it back above both the 1.3500 and also the 1.3700-1.3670 areas once again, and even just a bit above the 1.3750-1.3800 area.

Yet the weakening of the non-US DOLLAR DEVELOPED CURRENCIES under the weight of the resurgent COVID-19 pandemic (especially in the UK and parts of Europe) had seen it stall back into that area of late, also with weekly MA-41 at 1.3835. It was also weakening back below weekly MA-9 and MA-13 in the 1.3700 area, and further below the 1.3571 July trading low has seen it finally fully below the 1.3500 area, with next interim support in the 1.3330 area that it also failed into earlier this week. That saw a test of the top of the 1.3200-1.3150 range (with next support not until the 1.2850 area) prior to the current rebound to 1.3300 area.

The **AUD/USD** early-November through December surge back above .7200, .7350-.7400 congestion as well as interim .7500 area was a strong sigh that led to temporary strength even above the .7650-.7700 resistance the subsequently fizzled. The next interim resistance was as nearby as the recently exceeded .7800 area it was churning around prior to the resumption of recent weakness.

That left lower supports back into the interim .7500 area it previously dipped modestly below and then sagged further below again. The key lower supports are the recently neared congestion in the .7350-.7400 area and the .7200 area once again.

While recent stability had left it back up near .7500 once again, the COVID-19 Delta variant impact had it back down below .7350-.7400 area, with next interim support back into the .7200 but with the major support not until the .7000 area once again (as back in the Fall of 2020.) However, that leaves the current selloff back below the .7350-.7400 area after the failure to reach .7500 next resistance on the rally.

While it was recently back below the .7200 area once again with next support not until the .7000 area, the current rally back above both the .7200 area left it back near the 7350-.7400 area prior to the current weakness. While recently back below .7200 opened the door to the first test of the .7106 August spike selloff low, the recent recovery has it back above the 7350-.7400 area into a test of the .7500 area.

Yet the weakening of the non-US DOLLAR DEVELOPED CURRENCIES under the weight of the resurgent COVID-19 pandemic had seen it stall back into that area, also with weekly MA-41 in the .7540 area it is currently testing. While the pandemic is resurgent in the UK and parts of Europe, Australia had also seen a significant two-month surge in new cases to a record high of 2,744 per day earlier last month prior to falling. That might at least partially explain the current AUD/USD resilience, as it held its previous range in the 7350-.7400 area (also weekly MA-9 and MA-13) until last week, when the .7200 area support failed as well. Even below that early this week saw it also trade below the .7063 August trading low this side of the September-November 2020 major .7000 area trading lows prior to recovering back above .7063.

USD/JPY was the prima facie example of the extreme mid-February 2020 'haven' bid in the US DOLLAR, as the typical fellow 'haven' currency YEN came under heavy pressure on the USD/JPY surge above 110.00 for the first time since May 2019, leading to an immediate rally to the prominent 112.00-.50 area into the end of that week.

Yet here as well, once the US DOLLAR came under pressure on its loss of 'haven' status due to the COVID-19 spread in the previously safe US, at the end of February it 'crashed' back below the 110.00 area to Close into 108.00 again. Yet that did not hold since early March began on weakness that carried below the interim 106.00 area and once again below the 105.00-104.50 range (39-month trading low with major tests in March 2018, January 2018 and August 2019.)

On recent form it had been previously churning below 105.00-104.50 as recently as January prior to pushing aggressively back above both 106.00 and 108.00 into early March. That it was above both 106.00 and even 108.00 despite US DOLLAR strength is in line with the strength of other DEVELOPED CURRENCIES, and is thereby another 'risk-on' indication.

The bid leaving the other 'haven' currency reinforced the previous secular US DOLLAR weakness on the violation of higher USD/JPY resistance into 110.00 being temporarily violated into early April prior to weakening back down to hold a test of the 108.00 area.

Yet that lack of any 'haven' bid was once again reflected in USD/JPY stabilizing not much worse than the 110.00 area, and now surging up above the 112.00-.50 area with the next resistance into the 114.50-115.50 range. Having recently traded above the 114.73 November 2017 4-year trading high, it will be critical to see whether it can sustain activity above it on the current violation of that level.

Next resistance is not until 118.66 December 2016 trading high with further congestion back up into the interim 120.00-121.00 range that is part of the major December 2014 through February 2016 range with a high of 125.85. Yet in any event, the lack of any strength in the alternate 'haven' currency had indicated the lack of any crisis until now.

The USD/JPY drop back below 114.50-115.50 into the recent 112.73 trading low (also in the area of weekly MA-13) is telling on the return of at least a partial 'haven' bid in the YEN. Whether it also drops back below the 112.00-.50 area on the near-term will be a further indication of whether there might indeed be a more telling global problem looming.

And **EMERGING CURRENCIES** have become wide-ranging volatile markets, which are repeating their mostly similar tendencies under the recent stresses. That includes the extreme weakness of the outlier TURKISH LIRA, even as there is general weakness against the US DOLLAR on various 'macro' influences like inflation and the COVID-19 resurgence.

SA RAND had seen **USD/ZAR** failing in early April on renewed 'risk on' psychology violating the next interim support in the 14.70 area (part of the major range from late-2018 through early-2020), even if there was more major support into the 14.50-.45 area it had tested and held back in December through February. While the previous US DOLLAR rallies had seen USD/ZAR ratchet back above the 15.00 area to vigorously test the 15.40-.50 range again, it ultimately reverted to weakness.

That left 14.70 area (in the overall major range from late-2018 through early-2020) next support that had been violated more completely in late March. While that also opened the door for a test of more major support into 14.50-.45 area seen in both December and February, only on the mid-April weakness was that area violated on a weekly Close. Back below the 14.50-.45 area again overall left USD/ZAR nearer to the 14.00 area, and the prominent historic congestion into the upper 13.00s (including the very important 13.81 July 2019 26-month trading low.)

A new round of weakness in late April set in motion to a new 27-month trading low below the July 2019 13.81 trading low. That left the next interim support at 13.55-.50 which was temporarily overrun into early June, and the 13.23 February 2019 33-month trading low as the next major level that was not quite reached. Yet in the wake of FOMC moving to a seemingly more aggressive tightening, it was back above the 13.80 and 14.00 areas, with next interim resistance into recent 14.20 congestion it also pushed above prior to the recent retest.

Yet more major influence is now likely further COVID-19 Delta concerns. After its inability to sustain weakness back below the 14.20, next resistance was into 14.40-.50 area. That was vigorously tested again of late, and was finally exceeded on South African political violence adding to its already substantial COVID-19 woes.

Even though the violence had abated, the RAND remained weak after a churn around the higher interim area around 14.70 area (with weekly MA-41 at 14.72 at that time.) However, that is with the more prominent recent and historic congestion into the 15.00-.10 area it was recently above, only stopping into the next congestion in the mid-15.00 area.

Yet the renewed risk appetite has been very prominent in USD/ZAR, with the slide since early last week dropping back below 15.00-.10 area, 14.80-.70 and even the 14.40-.50 area, leaving 14.20 once again as the next key congestion (early-August trading low.) While that had held previous, activity back above 14.40-.50 area had left it challenging the 14.70-.80 resistance.

With that violated it has also pushed above the significant 15.00 area congestion. On historic form that did not leave and resistance until recent trading highs in the 15.40 area initially, yet more significantly into the 15.55-.65 area (January and March 2021 trading highs.) That said, the recent drop back below 15.00 left the 14.80 area prominent once again.

Violating that also saw the 14.40-.50 area being vigorously tested. However, the volatile churn has quickly carried back above those levels to see it back above the 15.00-.10 area, and now and now above both the 15.40-.50 area as well as the key higher level above at the January 15.65 12-month trading high.

That is also historic congestion, and it being exceeded points to next resistance initially at the 16.07 September 2020 trading low, yet with heavier congestion the 16.30 area having stalled the rally for now. For more of a view, please see the weekly continuation chart from two weeks ago Friday (<https://bit.ly/3kWkUjS>), which also includes the Inverse Head & Shoulders pattern.

Even when other EMERGING CURRENCIES have reacted to the downside of late, the **RUSSIAN RUBLE** had seen **USD/RUB** weaken at times on the back of sustained CRUDE OIL strength. The USD/RUB drop back below 75.00 since late April has seen it even slip below the 73.00-72.50 area prior to the recent recovery back above it.

That recent break was despite US sanctions and the weakness of other EMERGING CURRENCIES in the wake of the previous FOMC announcements and Chair Powell's press conference prior to recovering. Lower support is the 72.00-71.75 interim area (albeit still at a 10-month trading low) with the next major support still into the 71.00-70.00 area that was temporarily violated on the previous OPEC negotiations disarray.

However, after the recent OPEC disruption USD/RUB was back above 73.00-72.50 area to nearer the 75.00 area prior to weakening once again to retest 73.00-72.50 area. After that held, weakening WTI CRUDE OIL prices had seen it rally back near 75.00 once again prior to stalling.

However, the recent major WTI CRUDE OIL recovery back above 70.00 had seen it drop back slightly below the 73.00-72.50 area prior to stabilizing in that range again. While it pushed up despite general EMERGING CURRENCIES weakness, it was recently back into that range.

Sustained WTI CRUDE OIL strength has left it below that range, with next support into the 71.00-70.00 currently being vigorously tested for the first time since June 2020 and even some early week slippage toward 69.00.

While the more major support is into the 68.00 area low from earlier that month, with a weekly 68.66 weekly UP Closing Price Reversal along the way, the current softening of energy markets and general pressure on EMERGING CURRENCIES had USD/RUB back above 71.00-70.00 into the 73.00-72.50 area. The further weakening of CRUDE OIL had it retesting the 75.00 area as well prior to its recent slippage.

The **MEXICAN PESO** saw **USD/MXN** selloff after the early-mid March surge quickly violated the lower interim 20.90 congestion, with the interim 20.65 congestion also violated on the way to the broad berth next support in the 20.25 area. That included an important 20.30-.10 weekly chart gap from on the way up in March of last year that had already been violated last November.

It then failed once again into a retest of the additional significant historic congestion (2018-2019) in the 19.80 area, with the next hefty historic congestion as nearby as the recently very vigorously tested 19.65-.50 area. The overall bottom of the very significant late-2018 through early-2020 range is not until the 18.50-.40 range.

That was even allowing there are interesting interim supports at 19.30 and into the 19.00-18.90 range. That said, the current rally back above 19.80 was more critical even after the previous failure as nearby as the 20.25-.30 area.

Now slightly back above 20.00 leaves that as the near-term consideration on a weakening 'risk-on' psychology despite what seems to be some support from sustained CRUDE OIL strength.

While higher hefty congestion is the 20.30 area, there is also the higher 20.65 congestion it traded very temporarily above in mid-June prior to weakening below 20.00 again. While next higher resistance is the 20.90 congestion, the focus shifts more so to the 20.00 and 20.30 congestion areas once again after its recent inability to fail on serial tests of the 19.80 area.

Despite the recent CRUDE OIL slippage back below the 75.00-74.00 area leaving USD/MXN weakening back below 20.00, the extended CRUDE OIL weakness below even 71.00-70.00 nearer to 65.00 support prior left USD/MXN back up above 20.00 area to nearer 20.25-.30. However, the restrengthening of CRUDE OIL had USD/MXN back down into the 19.80 area, which it has interestingly held despite the partial return to CRUDE OIL weakness.

Yet the extended energy market drop that had seen it back above 20.00 after recent serial tests of the 19.80 area is now reversed. However, after breaching the recent hefty 20.25 area congestion (also tied into the 20.10 weekly MA-41 at that time) it is back below it. Recently back below the 20.00 area (also weekly MA-9 and MA-13) brought the 19.80 area back into focus prior to the push back above 20.00.

Having now breached the 20.20-.25 area as well as surging above the August 20.45 trading high. The next resistance is the 20.75 June trading high it temporarily exceeded early last week and remains near, with the higher significant congestion above that not until the 21.00 and 21.40-.50 range. Yet while it was a delayed reaction, sustained CRUDE OIL strength had seen it weaken back below the 20.75 and 20.45 levels once again into the 20.20-.25 area.

That is also very important on all of the weekly Mas (including MA-41) being just below the 20.20 level, which it has held on recent tests, and has seen USD/MXN rally back above 20.45 and even above the 20.75 level. Now also above the 21.00 area leaves USD/MXN pushing up to a new 8-month high.

That is into a March 21.30-.40 topping signal, with that period's 21.63 trading high being a critical level. Out above it last week saw a test of 22.00 prior to the weakness back below all of those areas back toward 21.00.

The TURKISH LIRA had been back under pressure since **USD/TRY** pushed back above the 8.00 hefty late 2020 congestion back in March. That left the LIRA as the outlier weak sister, with the inability of USD/TRY to drop below 8.00 turning into another bout of strength back above recent 8.20-8.23 short term congestion.

While it was slightly below that until mid-April, the recent weaker indication was a late April daily DOWN Closing Price Reversal from 8.3750, which left 8.40 as a general Tolerance that needed to be watched into May. Above that again in line with the other EMERGING CURRENCIES weakening on the temporarily diminished 'risk-on' psychology into mid-May reversed into USD/TRY strength once again.

While that left the door open to a full retest of last November's 8.5146 all-time high weekly Close, with only the 8.5765 coincident all-time high above that. While the LIRA seemed to firm on the mid-May return of the 'risk-on' psychology, that did not even bring a USD/TRY drop back to the 8.23-8.20 range. And while it recently did drop back near that lower interim congestion last week, it was then surging back up to somewhat above the late-May 8.7424 all-time high.

However, there has been a contrarian LIRA rally last week into this week on USD/TRY slipping back slightly below the late-May 8.7424 all-time high. That said, the more important near-term lower support is now the recent 8.52-8.45 area congestion it had slipped below nearer to that 8.23-8.20 range earlier this week prior to recovering into the 8.52-8.45 area once again.

Yet it is now the case that weekly MA-13 and MA-9 have stalled up into the 8.54-8.57 range, reinforcing resistance around that 8.5764 previous major November 2020 all-time high. And the weekly Oscillator indications suggest that it was up against near-term weekly Oscillator thresholds prior to the recent more prominent selloff.

While the more critical thresholds (reinforced by previous topping into the minor new highs) were into June's 8.7917 all-time high, those moot after the recent two-month selloff. The subsequent USD/TRY weakness had left it more so down vigorously testing the early-August 8.2960 and early-June 8.2832 trading lows, with the more prominent support down into the 8.00 area (including weekly MA-41.)

Yet the weakening of EMERGING CURRENCIES had seen USD/TRY surge back above the 8.50 area (also still weekly MA-13 and MA-9) and back above congestion around the late-May 8.7424 all-time high. Also above June's previous 8.79 all-time high saw it up into a 9.2600 new mid-October all-time high today. This was also a key weekly Oscillator threshold.

After that was exceeded, the rise of MA-41 projected the next week's major threshold into the 9.30-9.35 area (MA-41 plus 1.05-1.10.) Above that as well on recent weekly Closes meant the higher Oscillator threshold was not until 9.95 (MA-41 plus 1.51 still rising 0.05 per week) only seen on the November 2020 surge. Having also exceeded that only left the major August 2018 runaway upside levels at weekly MA-41 plus 0.220 that was in the 10.70 area last week.

Yet all of that became moot early this week, as the hands down 'biggest loser' of EMERGING CURRENCIES follies of the past several weeks is the TURKISH LIRA, as is apparent on the USD/TRY weekly chart through two weeks ago Friday (<https://bit.ly/3FDiZss>.) It had already Accelerated UP through 10.60 'return line' of the major channel (broader chart indication) from the March 2018 last trading low prior to the upward explosion to the 6.40 Close and 7.10 high.

Of note, quite a bit of LIRA weakness at that time was driven by Turkish President Erdogan's misguided philosophy that high interest rates cause inflation. Well, with Turkish inflation close to 20%, he is at it again, influencing the head of its central bank to likely drop its base rate from 16% to 15% in the near-term future. Let's see, if we are already only providing a negative real short-term yield of 4% and we drive that down to negative 5%, what might happen?

Of note, that 10.60 UP Acceleration level from last week was also very near the old all-time maximum plus 2.20 Oscillator threshold from 2018. No surprises there, as the longer term channel return lines and Oscillator levels are often two takes on the same overall conditions. Yet, the question out into a new all-time high that surpasses a maximum historic Oscillator threshold is what to do next?

Well, as indicated on the chart annotation (and as we have successfully done in other markets), it is reasonable to consider the ratio between the conditions prevalent at the previous high, and adjust them for the difference in values into a new situation.

Adjusting using the USD/TRY 10.60 level at which old Oscillator maximum was exceeded, we used the weekly 6.40 August 2018 Close that had indicated the plus 2.20 all-time Oscillator high at that time. Based on that, the 1.67 2021 to 2018 ratio indicated an extended Oscillator threshold of 3.68.

As noted in the chart annotation, adding that to last week's MA-41 projected an expanded Oscillator threshold of 12.20 last week. That comes with the caution that weekly MA-41 is now rising 0.10 per week, which is a torrid pace for that indicator (just take a look at the chart.)

All fine and good, except for one minor detail: USD/TRY had gone from Monday's 11.37 Close up to a 13.35 new all-time trading high last week Tuesday prior to slipping back to 12.20 area. This was a clear indication of what happens when a previously weak, misguided monetary policy meets the commitment to push it even further.

It was now interesting to see it not respect that 12.30 'extended' weekly Oscillator threshold last week, and it is indeed out into a world of its own on the further USD/TRY surge near the 14.00 area indicating a current weekly Oscillator reading of plus 4.50... completely shattering any previous premium, and leaving any future trend analysis until after the TURKISH LIRA stabilizes against other currencies, whether DEVELOPED or even EMERGING CURRENCIES.

Reports & Events

While still obviously less relevant (as we have been noting for some time and is most glaringly apparent again at present) on the standard report releases in the midst of more major global political and pandemic cross currents, the Weekly Report & Event Calendar (accessible for Sterling and higher level subscribers) is available via the www.rohr-blog.com sidebar.

Last week saw quite a bit of central bank influence despite no rate decision meetings, and some interesting NGO indications, like the OECD Economic Outlook. However, what was missing was any credible assessment of what the new highly transmissible COVID-19 Omicron variant means. That is because most of that information remains anecdotal, which led to much of the two-way volatility in many markets and a weakening of risk appetite.

In fact, due to that we are delaying our research note today in order to make a much better assessment of what we are referring to as 'Variant Three Card Monte'. This is a reference to the classical hustler's scam on cheating targets with an unwinnable choice in a playing card version of the classical 'shell game'. (For more on all of that for the uninitiated, please see the WIKI: https://en.wikipedia.org/wiki/Three-card_Monte.)

The difference here is that there is a way to mostly figure out the right 'guess' on what are going to be the dominant near-term and intermediate-term market influences. Stay tuned for that analysis. Even before we review that later in the research note, this week is quite an interesting reporting week. There is once again quite a bit of central bank and Non-Governmental Organization influence this week, which starts with Australian inflation data into German Factory Orders and Italian Retail Sales.

Tuesday is a much bigger day, starting with a variation of UK Retail Sales into Chinese trade numbers, a Reserve Bank of Australia rate decision and statement, and important European data (like German and Euro-zone ZEW Surveys.) Then it's onto a limited amount of Canadian and US data.

Wednesday is a more concise yet still very important day, beginning with Japanese trade numbers and its Economy Watchers Surveys into the ECB Research Bulletin, followed by a Bank of Canada rate decision and statement and US JOLTS Job Openings. Thursday gets back to being weightier, with Chinese inflation data into German trade numbers, followed by US Wholesale Trade Sales. Friday is another big day, with German inflation numbers into UK GDP and the usual array of associated data, and US CPI into Michigan Consumer Sentiment.

As such, in the context of the fast moving epidemiological changes that are probably going to be more of an anticipatory influence once again, we are obviously maintaining our recent advice that has been reinforced by markets of late: Keep those seat belts firmly fastened.
